# OUTLINE

---

- What is RADseq/Genotyping By Sequencing (GBS)
  - different protocols
    - Dr. Retz's protocol
  - experiment design

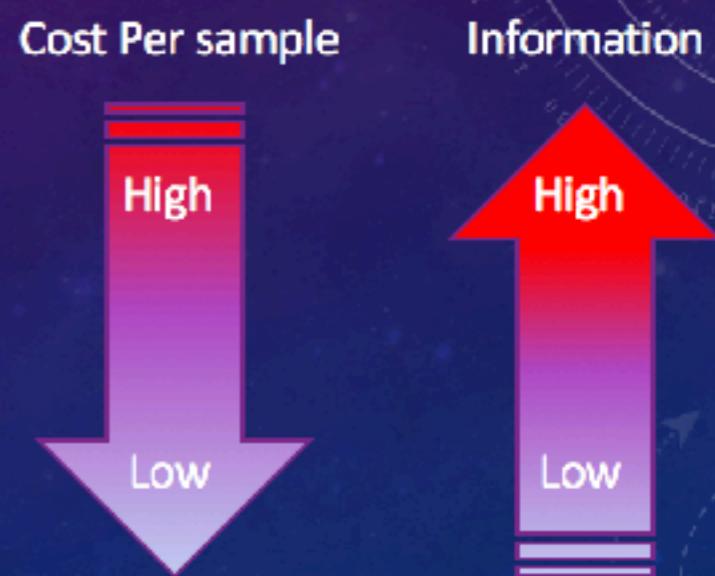

# OUTLINE

---

- Examples of RADseq/GBS applications
  - 1. For genome-wide variation discovery;
  - 2. Genetic Maps, QTL mapping
  - 3. Genome wide association study (GWAS), Genomic Selection (GS)
  - 3. Population genetics study
- Data analysis
  - general approach for NGS data analysis
  - Several GBS pipelines
- Hands on exercises

## APPROACHES FOR HIGH-THROUGHPUT GENOTYPING:

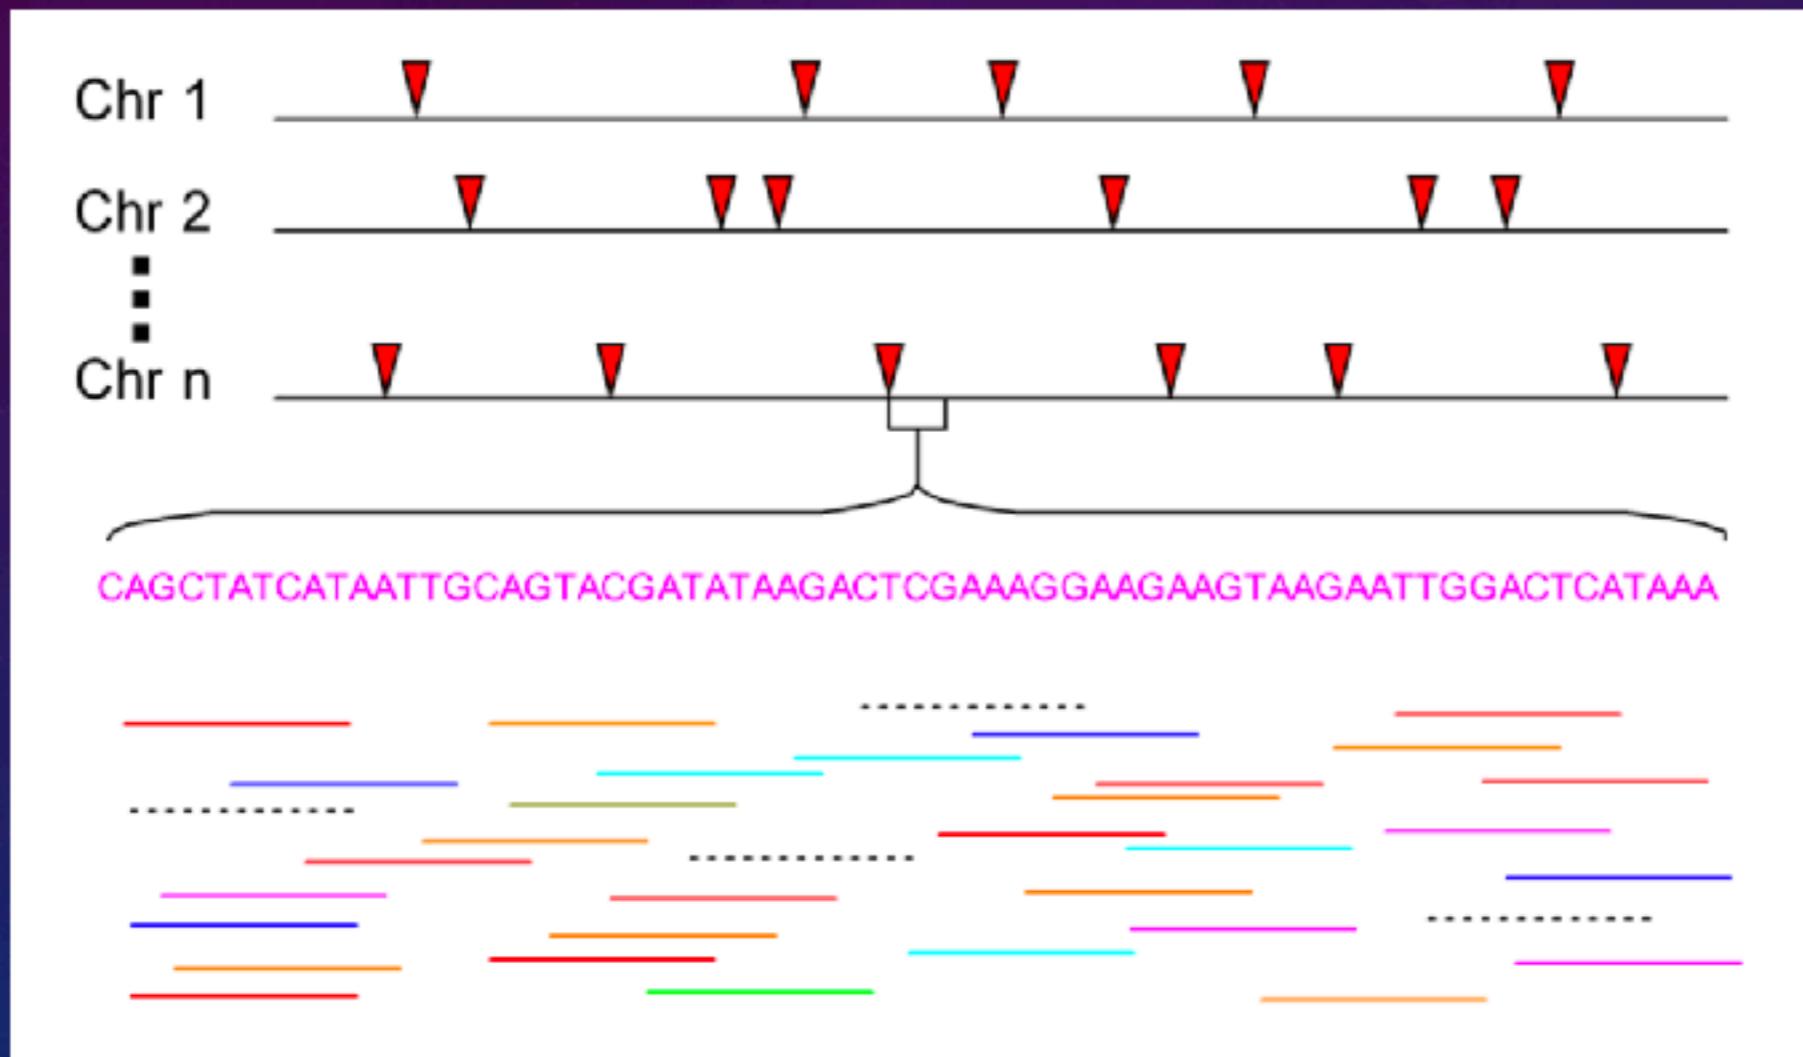

- Whole-genome re-sequencing
- Exome Capture + Sequencing
- Genotyping SNP assay: infinium 90K, Axiom 400K
- Reduced representation: RADseq, Genotyping By Sequencing

# WHY REDUCED REPRESENTATION?

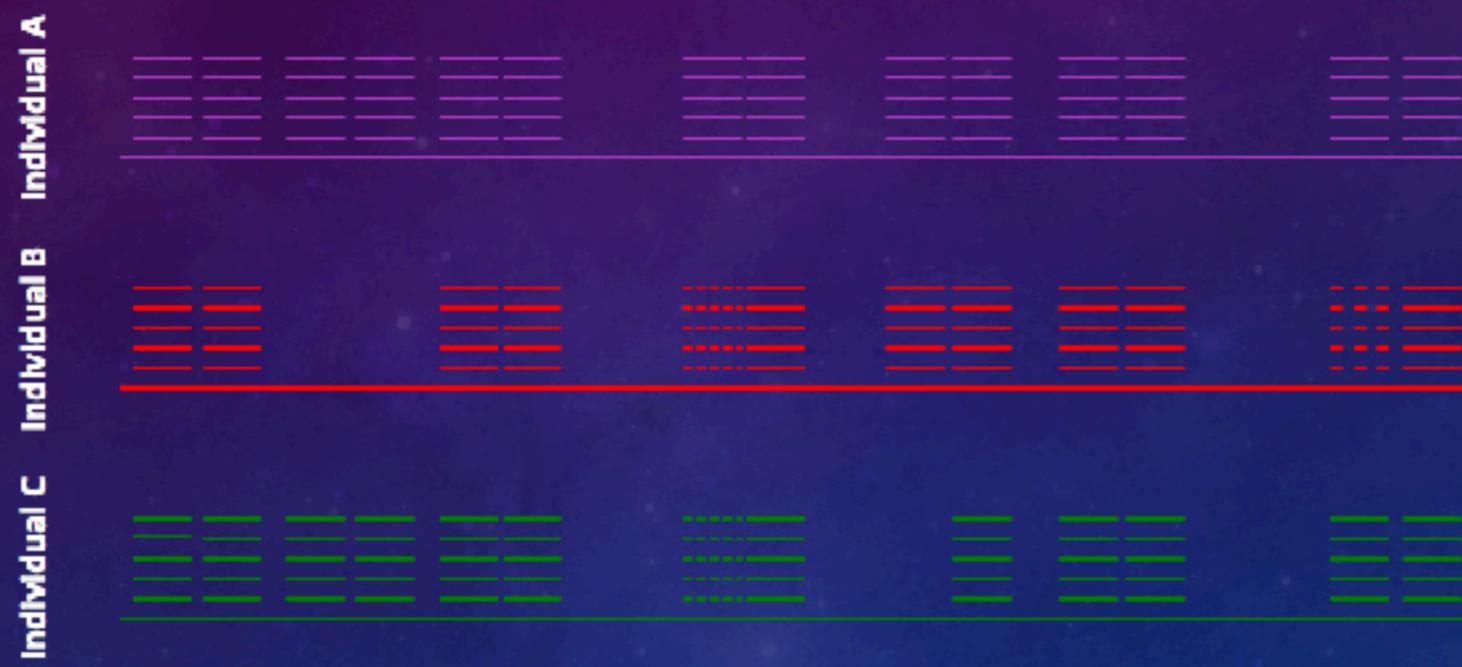

## REDUCED REPRESENTATION GENOME SEQUENCING: RADSEQ/GBS

Lu F et al. (2013) PLoS Genet 9: e1003215.

## REDUCED REPRESENTATION GENOME SEQUENCING: RADSEQ/GBS

- More even coverage than random shearing
- Requires less data
- Multiplexing, economically feasible

# RADSEQ/GENOTPING BY SEQUENCING

# SUMMARY

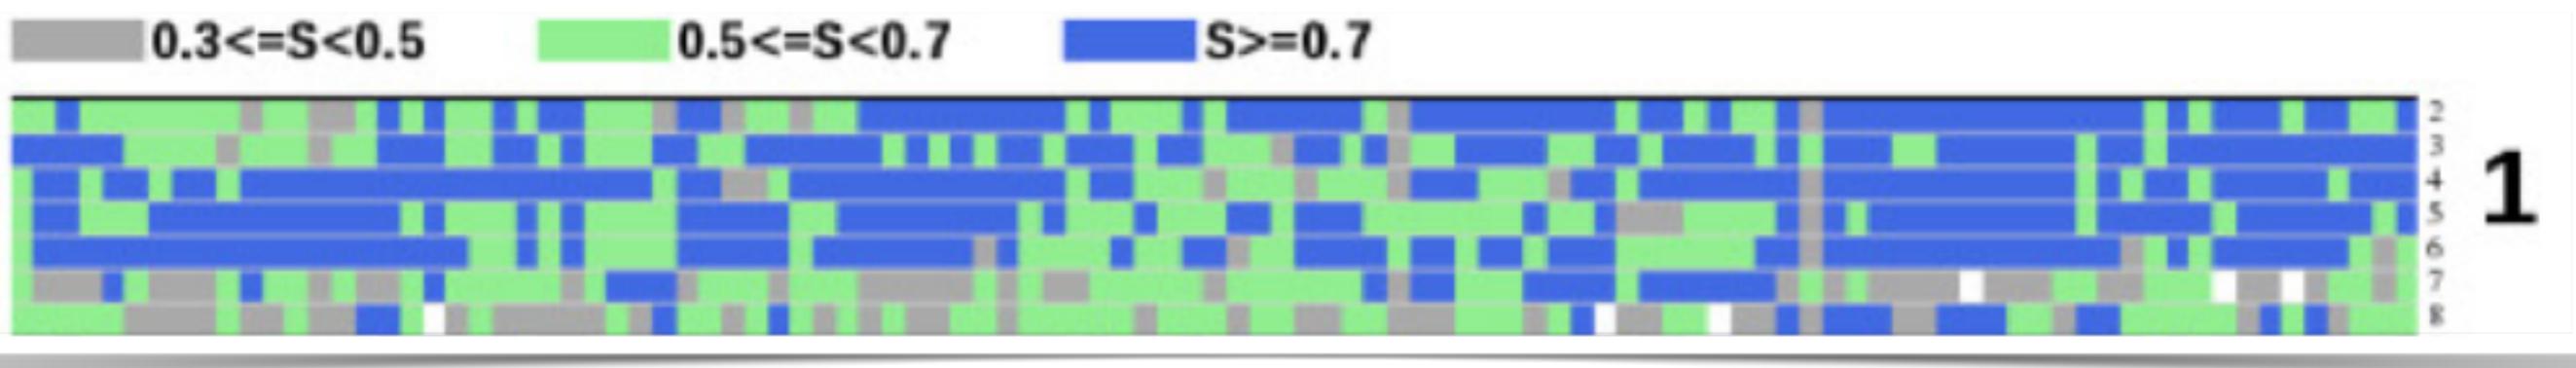

---

- Many protocols to be chosen from
- *In silico* digestion helps to pick the restriction enzymes
- Depends on the protocol, the subsequent data analysis might require adding/removing steps

# RADSEQ/GBS APPLICATION EXAMPLES

---

- Variation discovery
  - Single-nucleotide polymorphism discovery by high-throughput sequencing in sorghum. BMC Genomics. 2011
  - Sequencing from libraries constructed to limit sequencing to start at defined restriction sites led to genotyping 10-fold more SNPs..

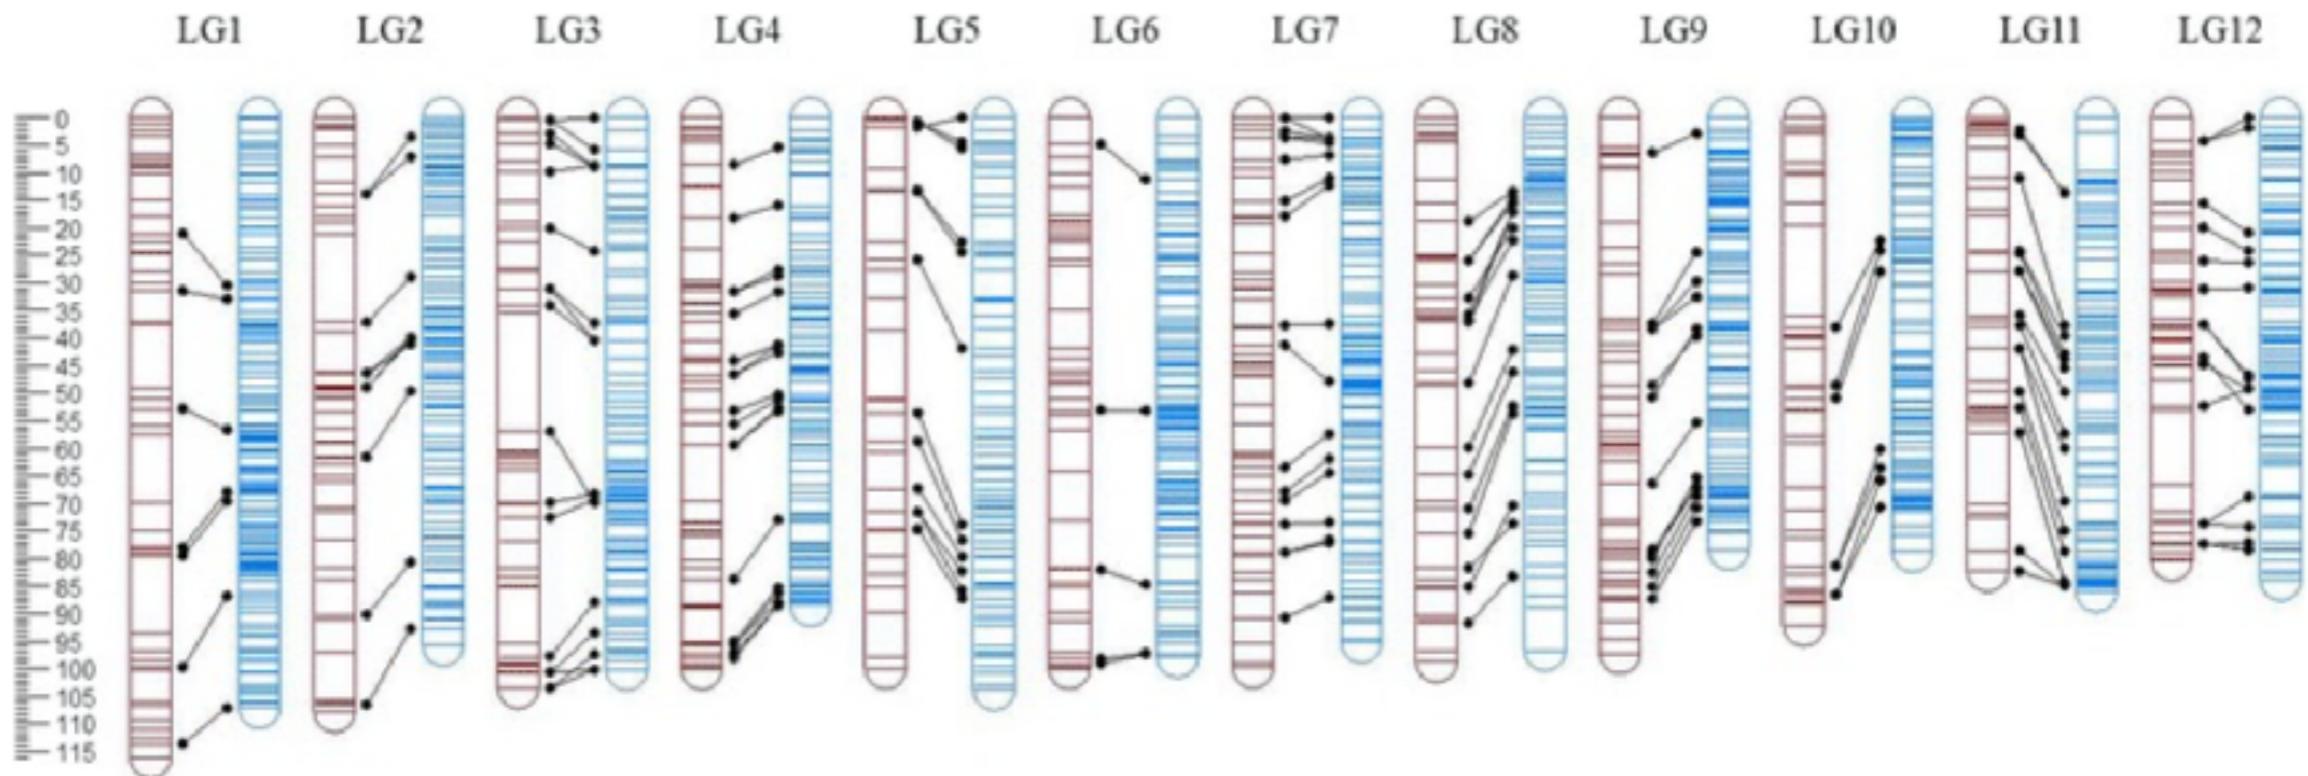

*Haplotype sharing patterns*

# RADSEQ/GBS APPLICATION EXAMPLES

---

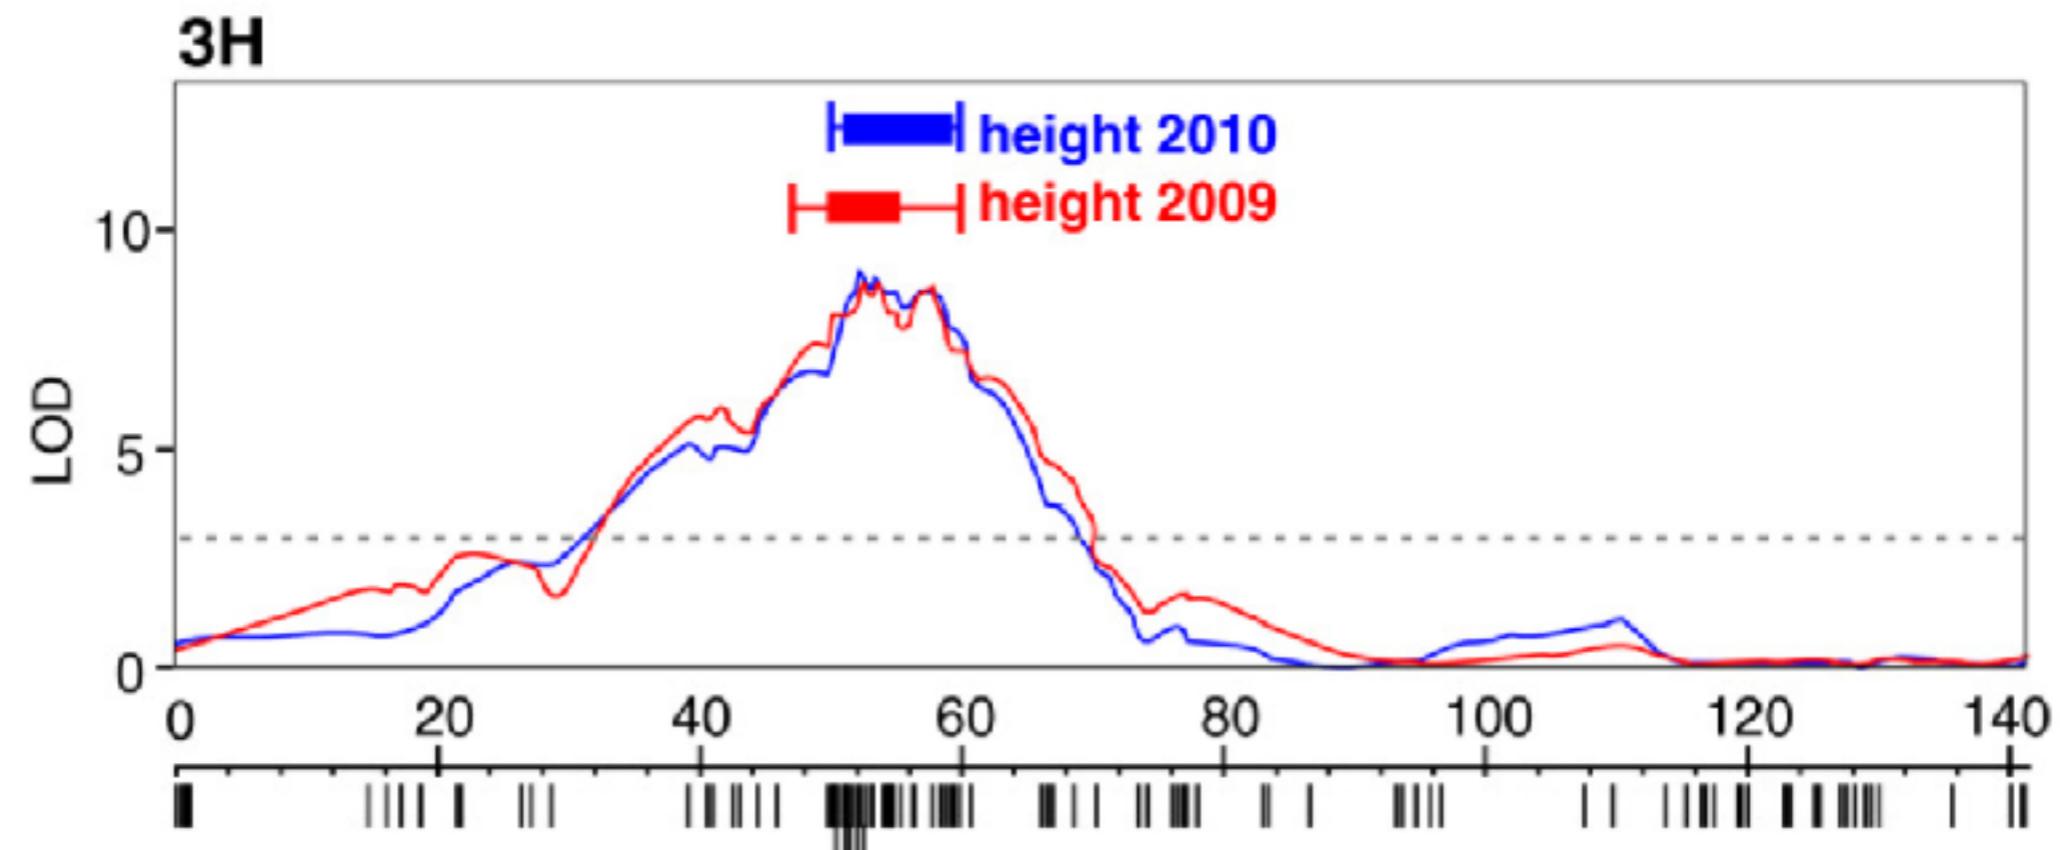

- Genetic Mapping
  - Exploiting genotyping by sequencing to characterize the genomic structure of the American cranberry through high-density linkage mapping, BMC Genomics. 2016
  - 10842 SNPs in total; 4849 markers were mapped.

# RADSEQ/GBS APPLICATION EXAMPLES

---

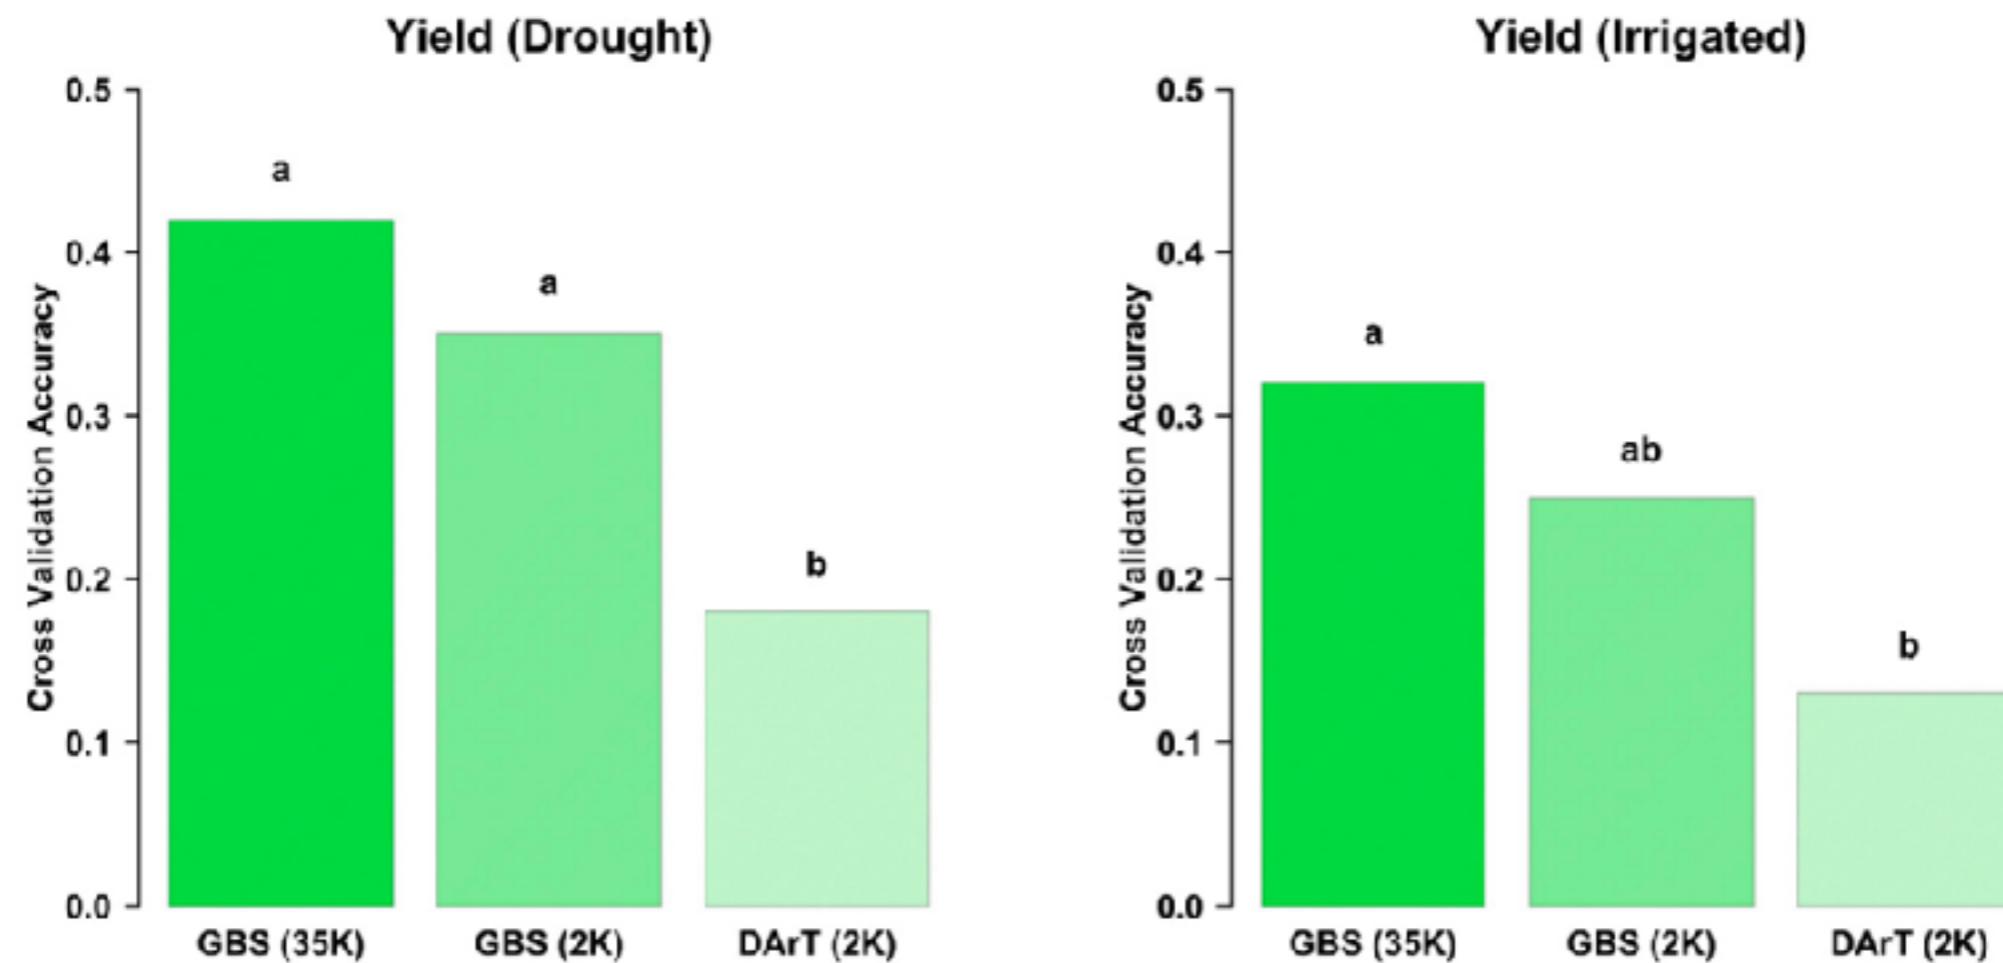

- QTL Mapping
  - An evaluation of genotyping by sequencing (GBS) to map the *Breviaristatum-e* (ari-e) locus in cultivated barley, BMC Genomics, 2014
    - In total, 461M categorized reads from the GPMx mapping population were mapped.... Using these highly conservative criteria, we identified an initial set of 1,949 co-dominant SNPs with robust allele calls across the population.

# RADSEQ/GBS APPLICATION EXAMPLES

---

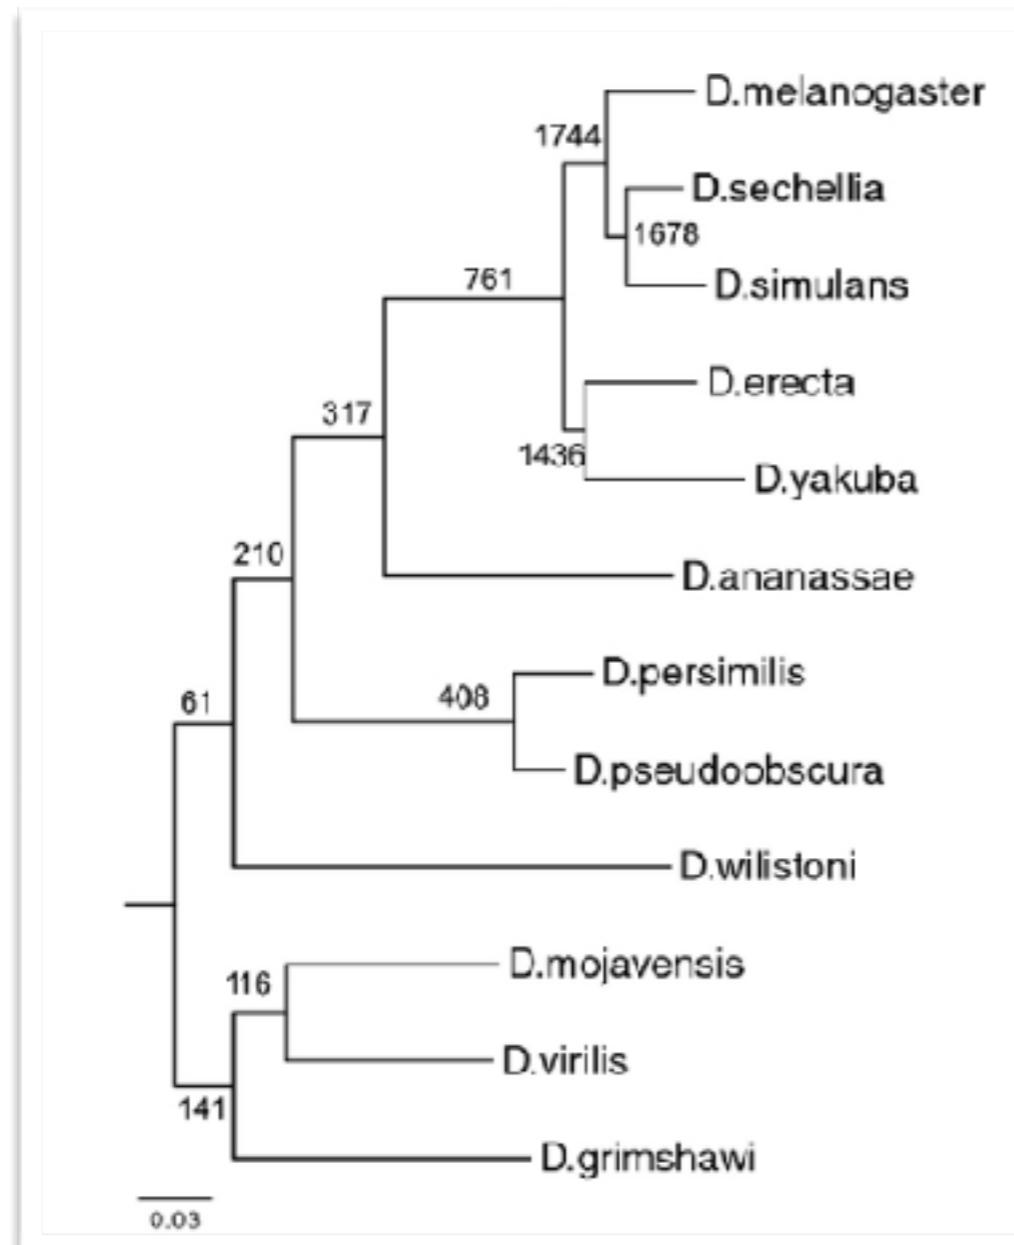

- Genomic Selection (GS)
  - GS uses genomewide molecular markers to predict complex, quantitative traits in animal and plant breeding.
  - Is GBS suitable for this task?

# RADSEQ/GBS APPLICATION EXAMPLES

---

- Phylogenetic inference
  - Is RAD-seq suitable for phylogenetic inference? An in silico assessment and optimization, Ecology and Evolution, 2013

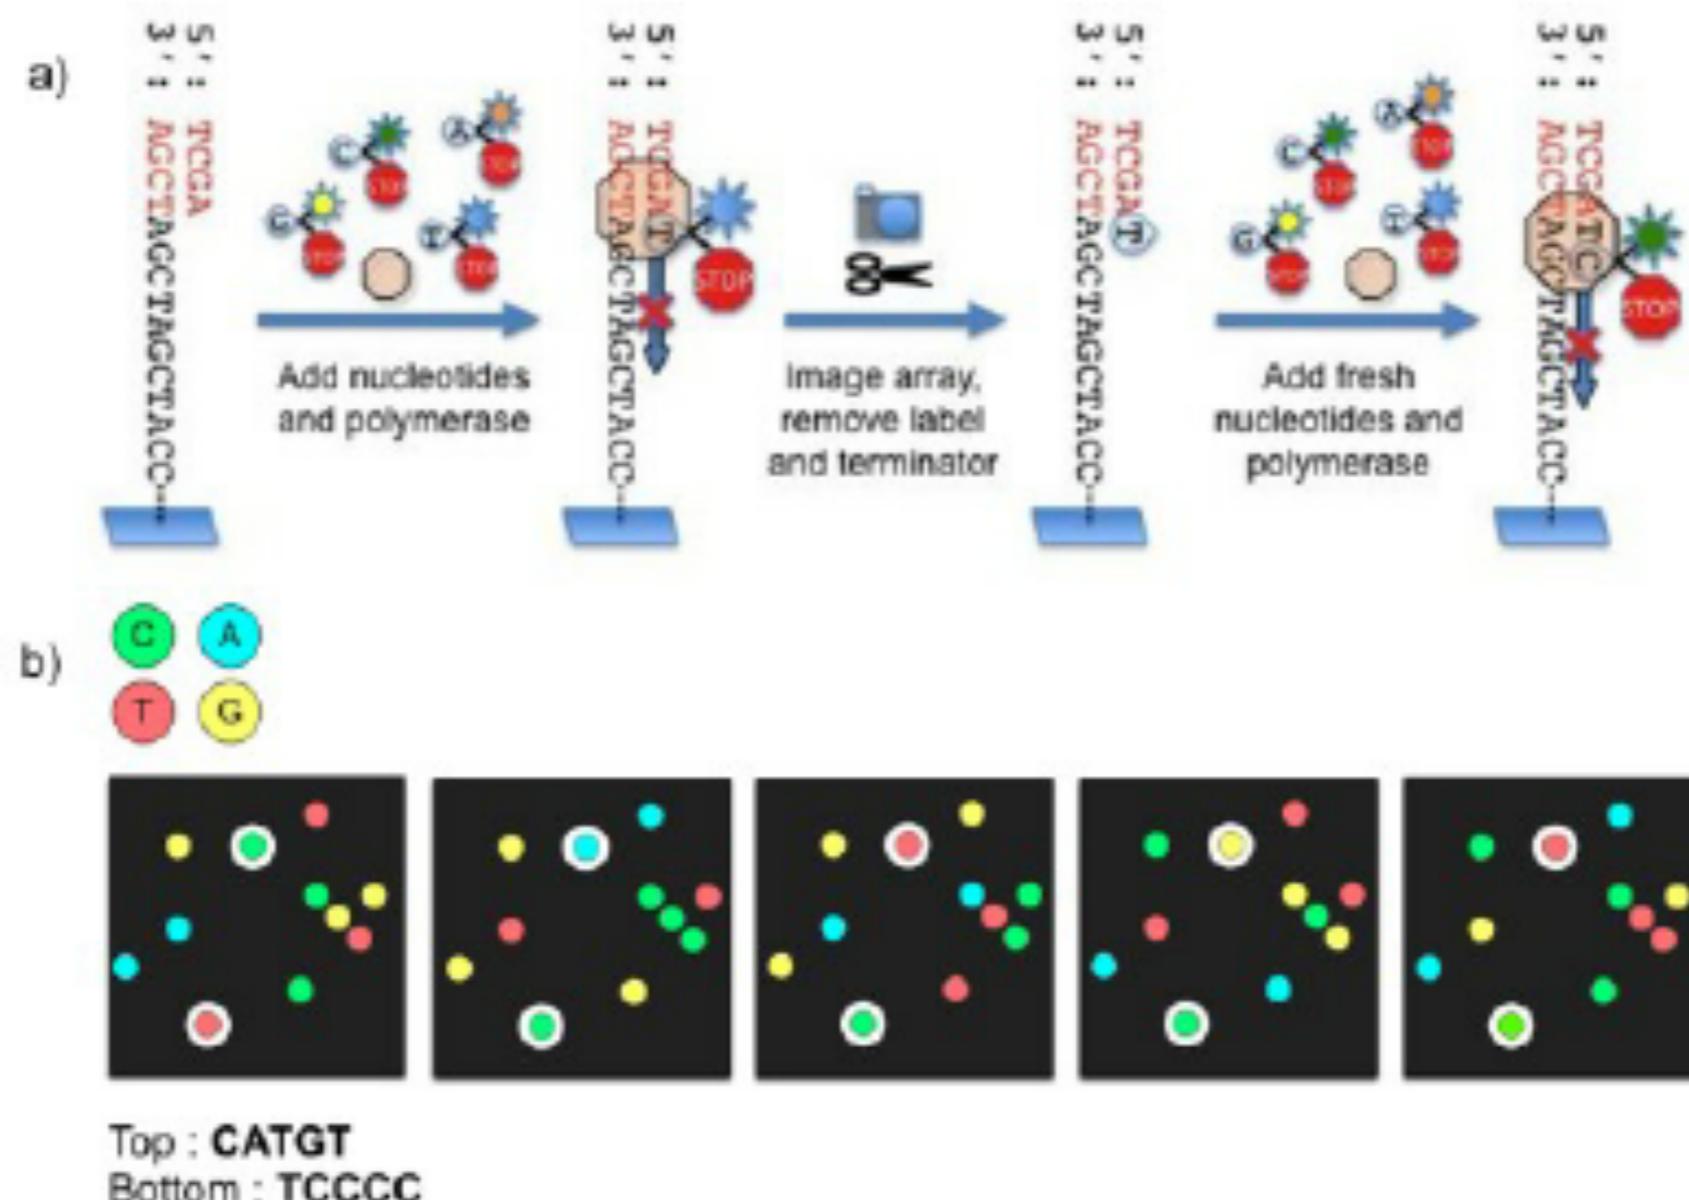

RAD-seq-based phylogeny of the 12 Drosophila species, based on 100-bp-long RAD-seq reads, inferred by maximum likelihood using PhyML 3.0.

?

# RADSEQ/GBS DATA ANALYSIS

# RADSEQ/GBS DATA ANALYSIS

- What kind of data being generated?
    - fastq format

# RADSEQ/GBS DATA ANALYSIS

- What kind of data being generated?

- fastq format

A quality score  $Q$  is an integer mapping of  $p$  (the probability that the base casting is wrong).

$$Q_{\text{sanger}} = -10 \log_{10} p$$

# RADSEQ/GBS DATA ANALYSIS

- What kind of data being generated?
    - fastq format
      - A typical GBS read

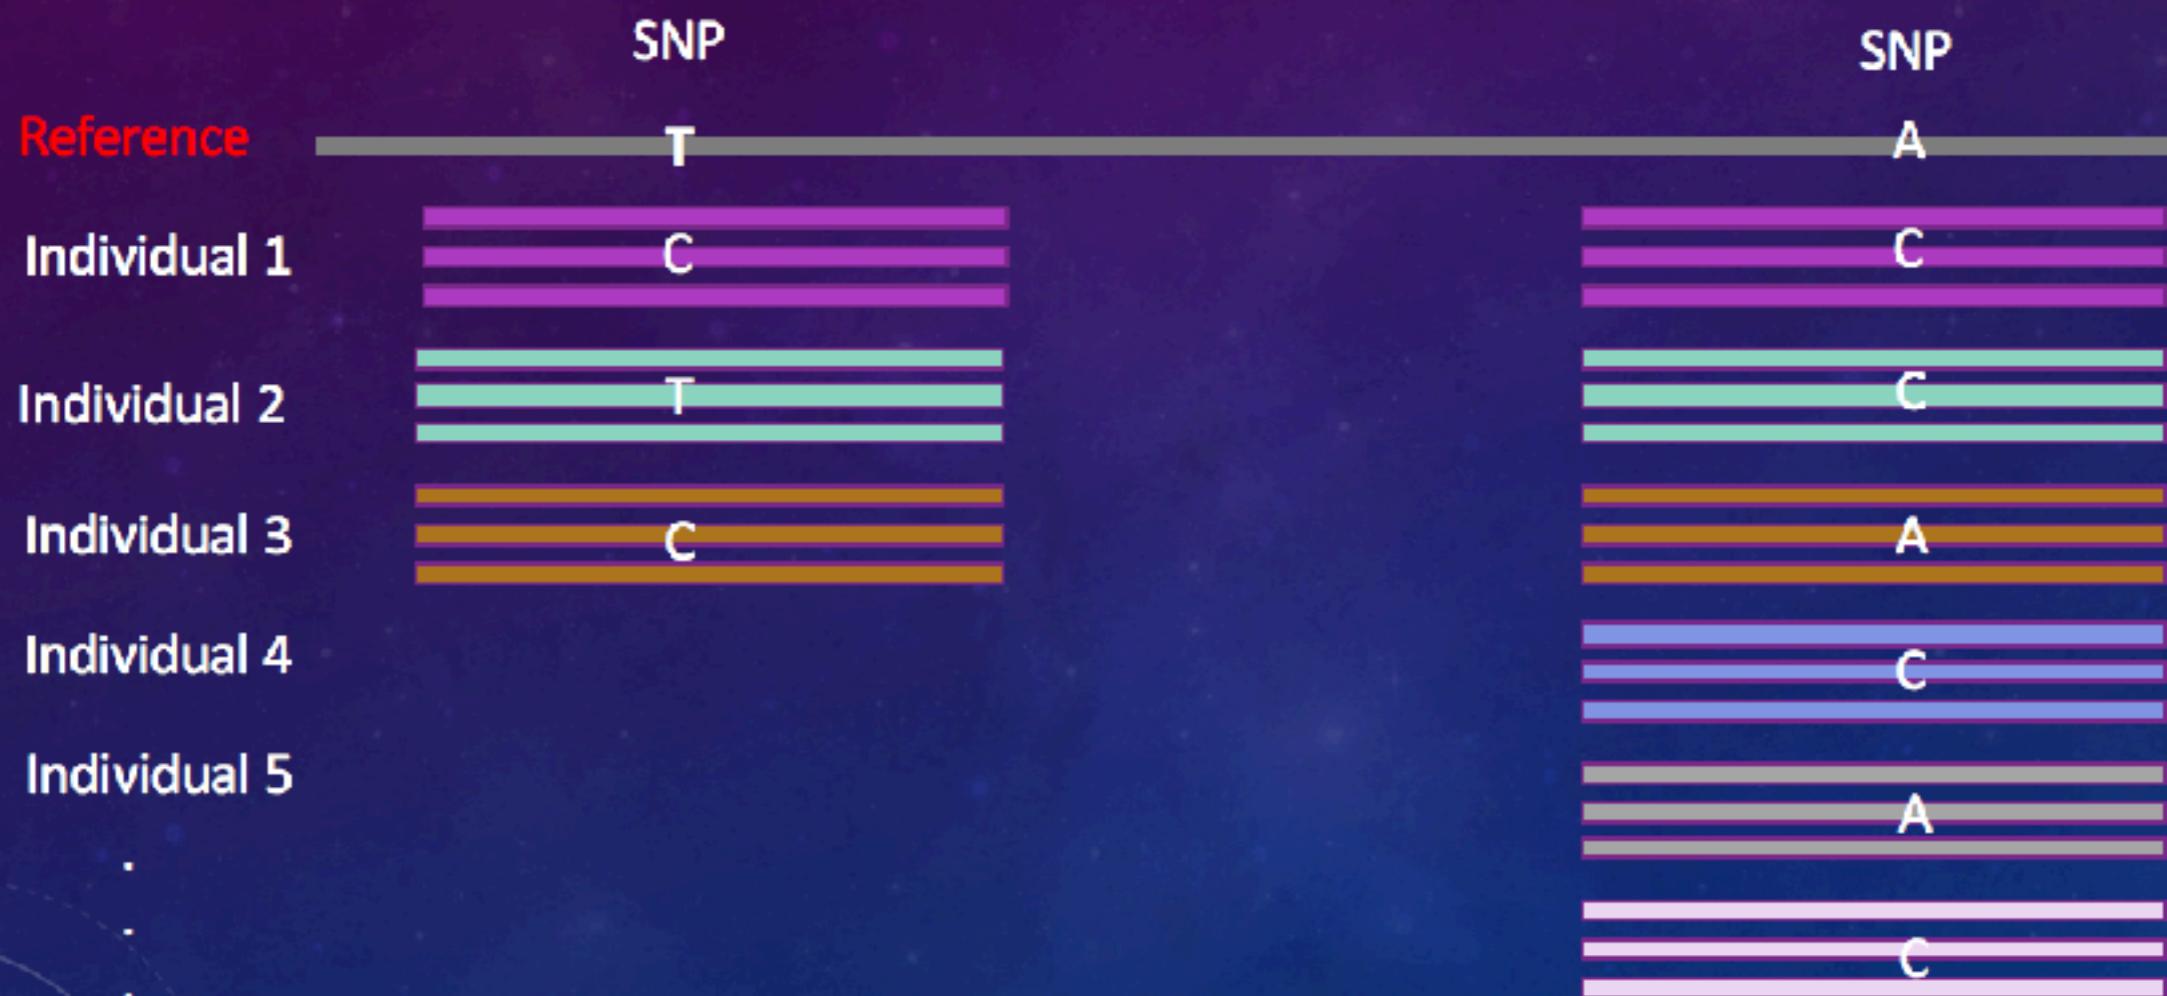

# RADSEQ/GBS DATA ANALYSIS

---

- Mainly two types of pipeline
  - Alignment-based
    - Treat GBS/RADseq data as usual NGS data
  - Clustering-based
    - Cluster the reads that are from the same loci, then discover variations within clusters (i.e. multiple sequence alignment)

# ALIGNMENT APPROACH

# CLUSTERING BASED APPROACH

1

## Clustering based on similarity

ANSWER

5

# RADSEQ/GBS DATA ANALYSIS

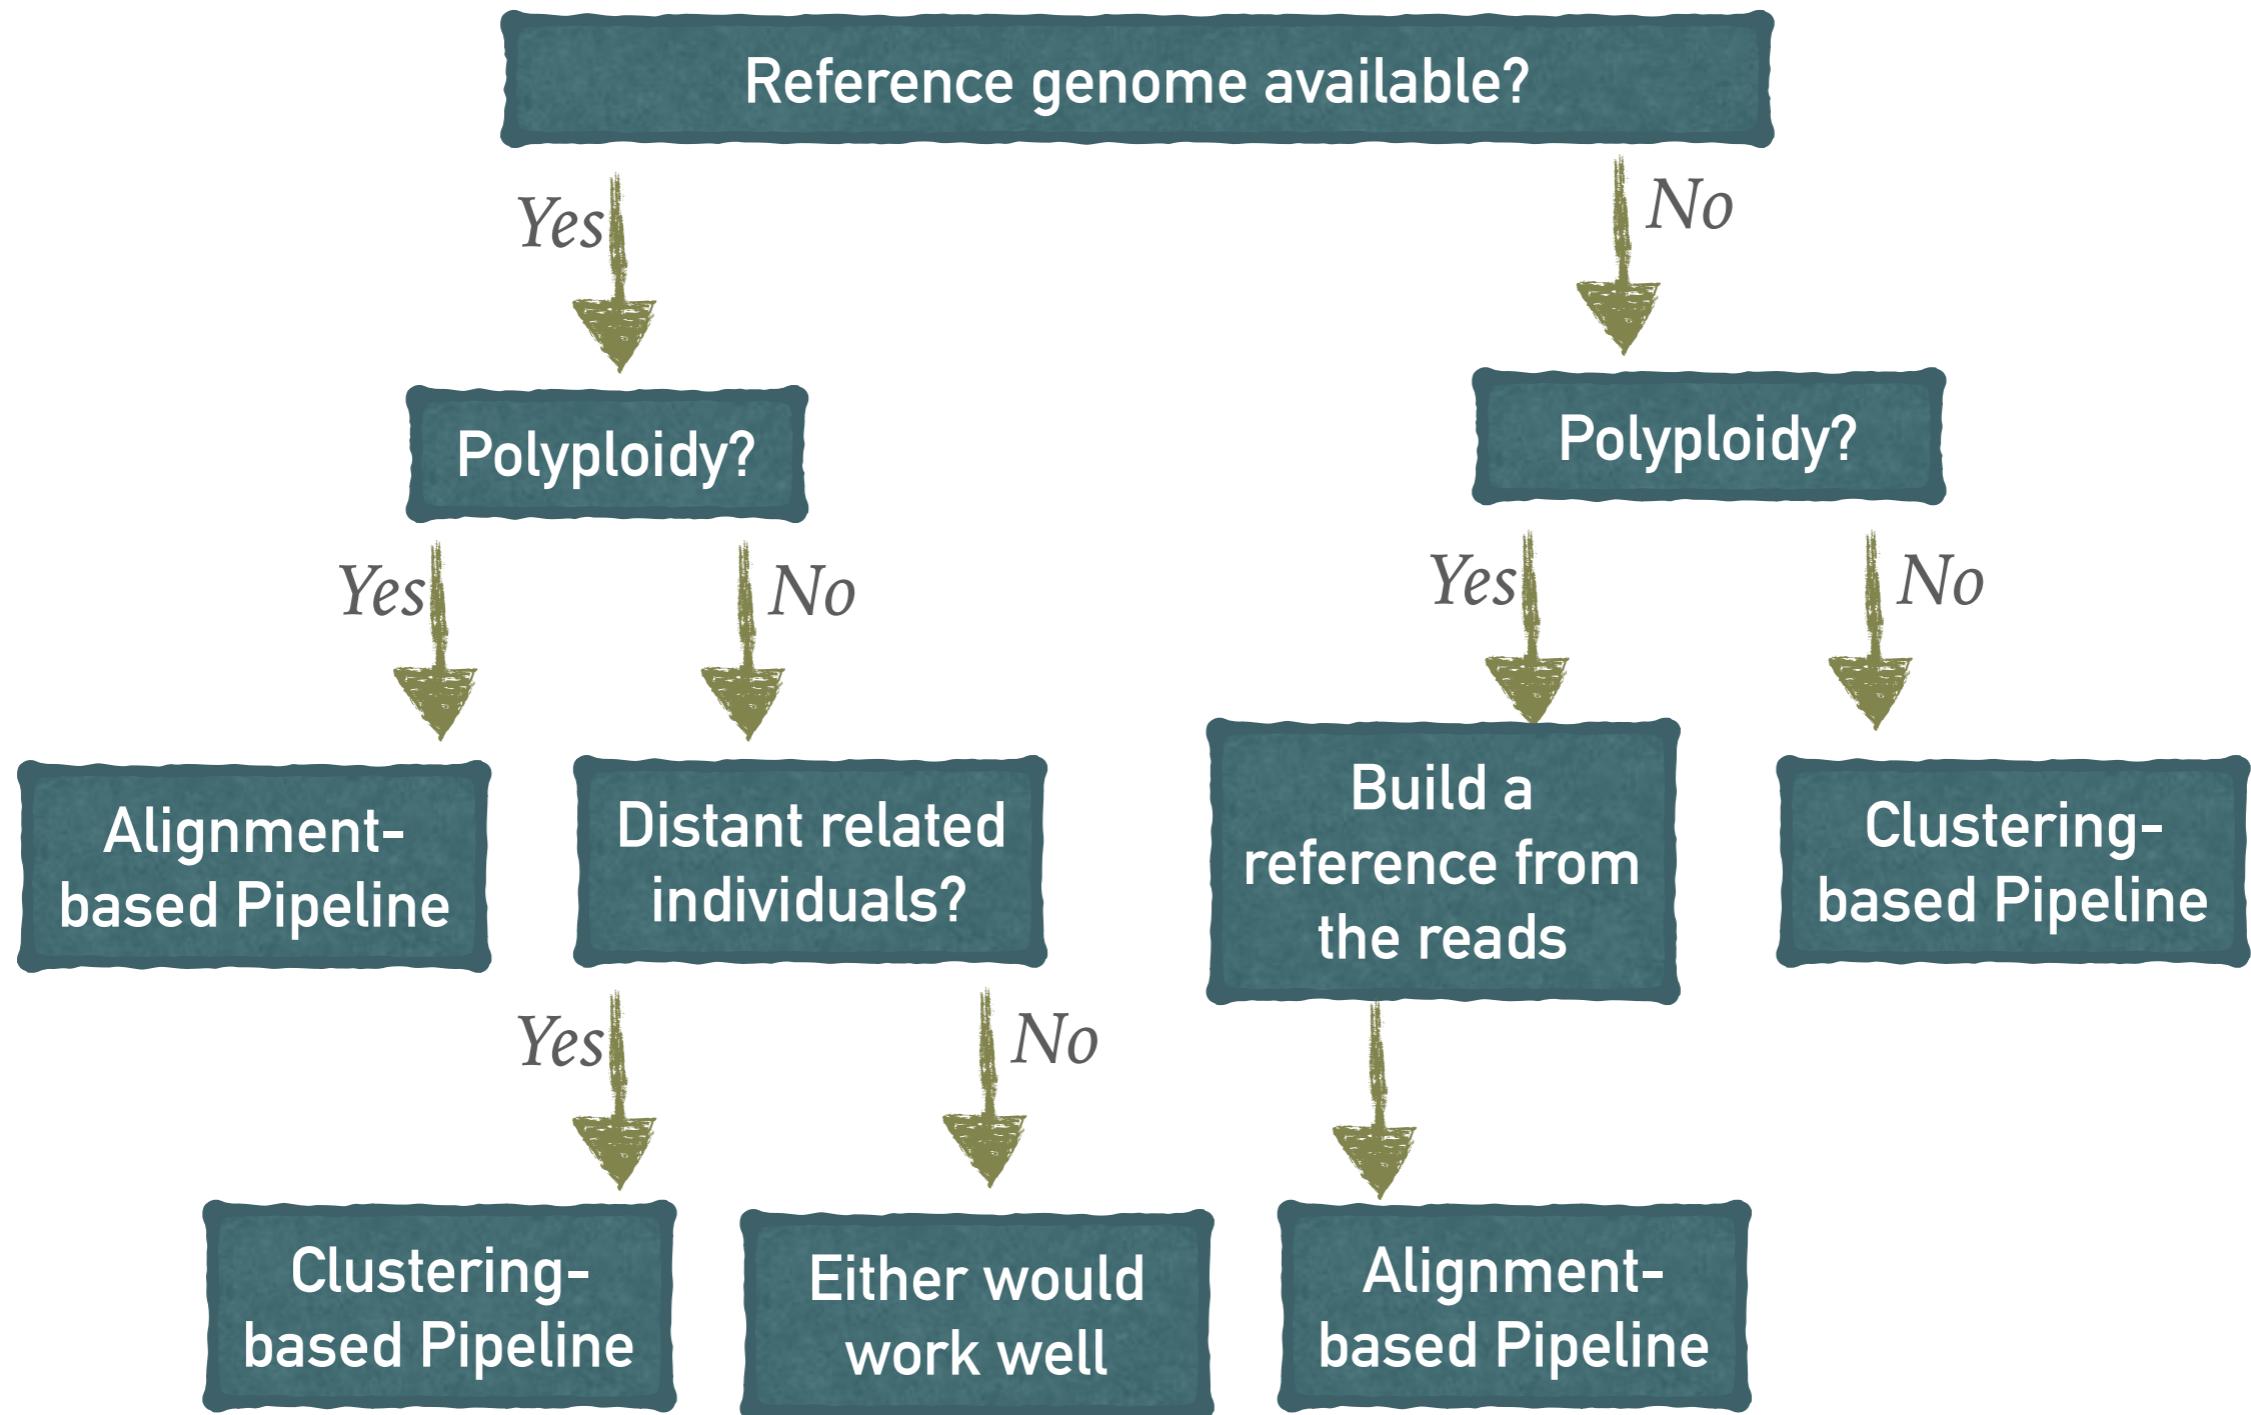

---

- Mainly two types of pipeline
  - Alignment-based
    - Results are easy to interpret; Imputation made easier
    - Require Ref; Computation intense; Miss novel variations
  - Clustering-based
    - Reduce the computation cost by clustering
    - Might lead to high false positive rate, or removing too many true variations with stringent filtering criteria

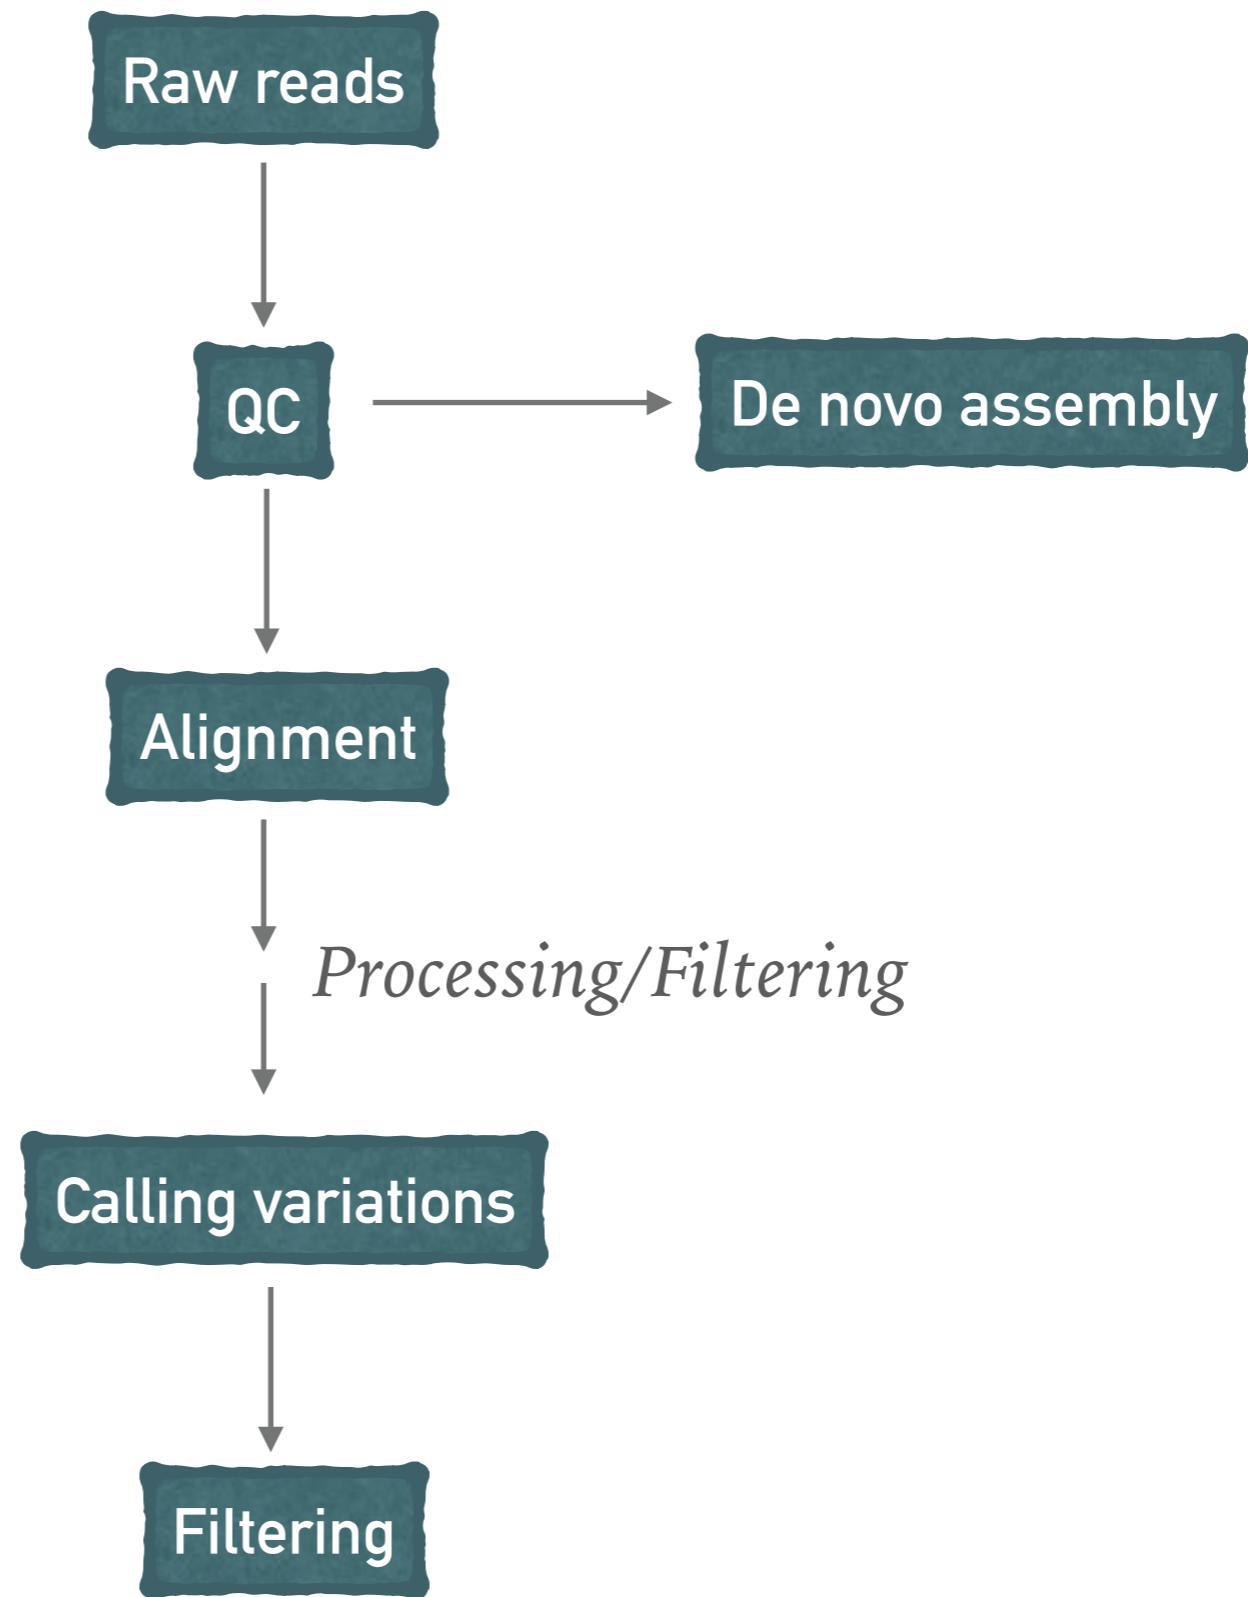

# RADSEQ/GBS DATA ANALYSIS

---

- Features of the two types of pipelines
  - Alignment-based
    - require reference
    - compute intensive
    - More accurate
    - Imputation might be easier
  - Clustering-based
    - reference not required
    - Reduce the computation cost by clustering
    - Might lead to large false positive, or removing too many variation with stringent filtering criteria

# *General NGS analysis workflow for variation discovery*

# RADSEQ/GBS DATA ANALYSIS PIPELINE

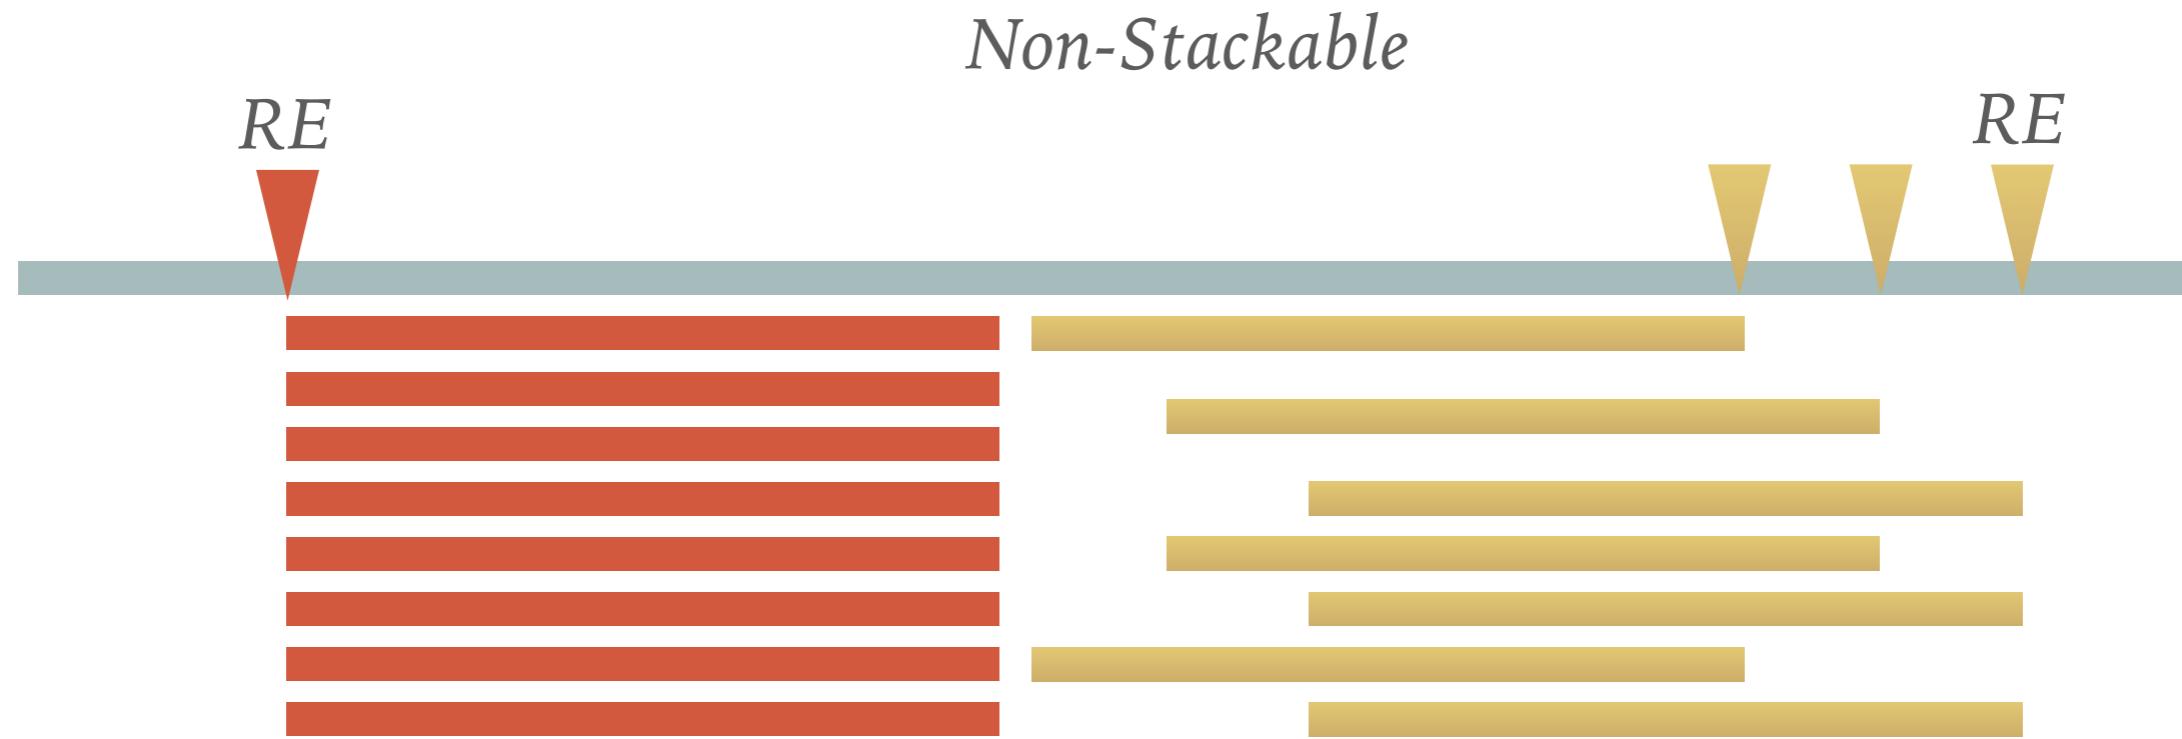

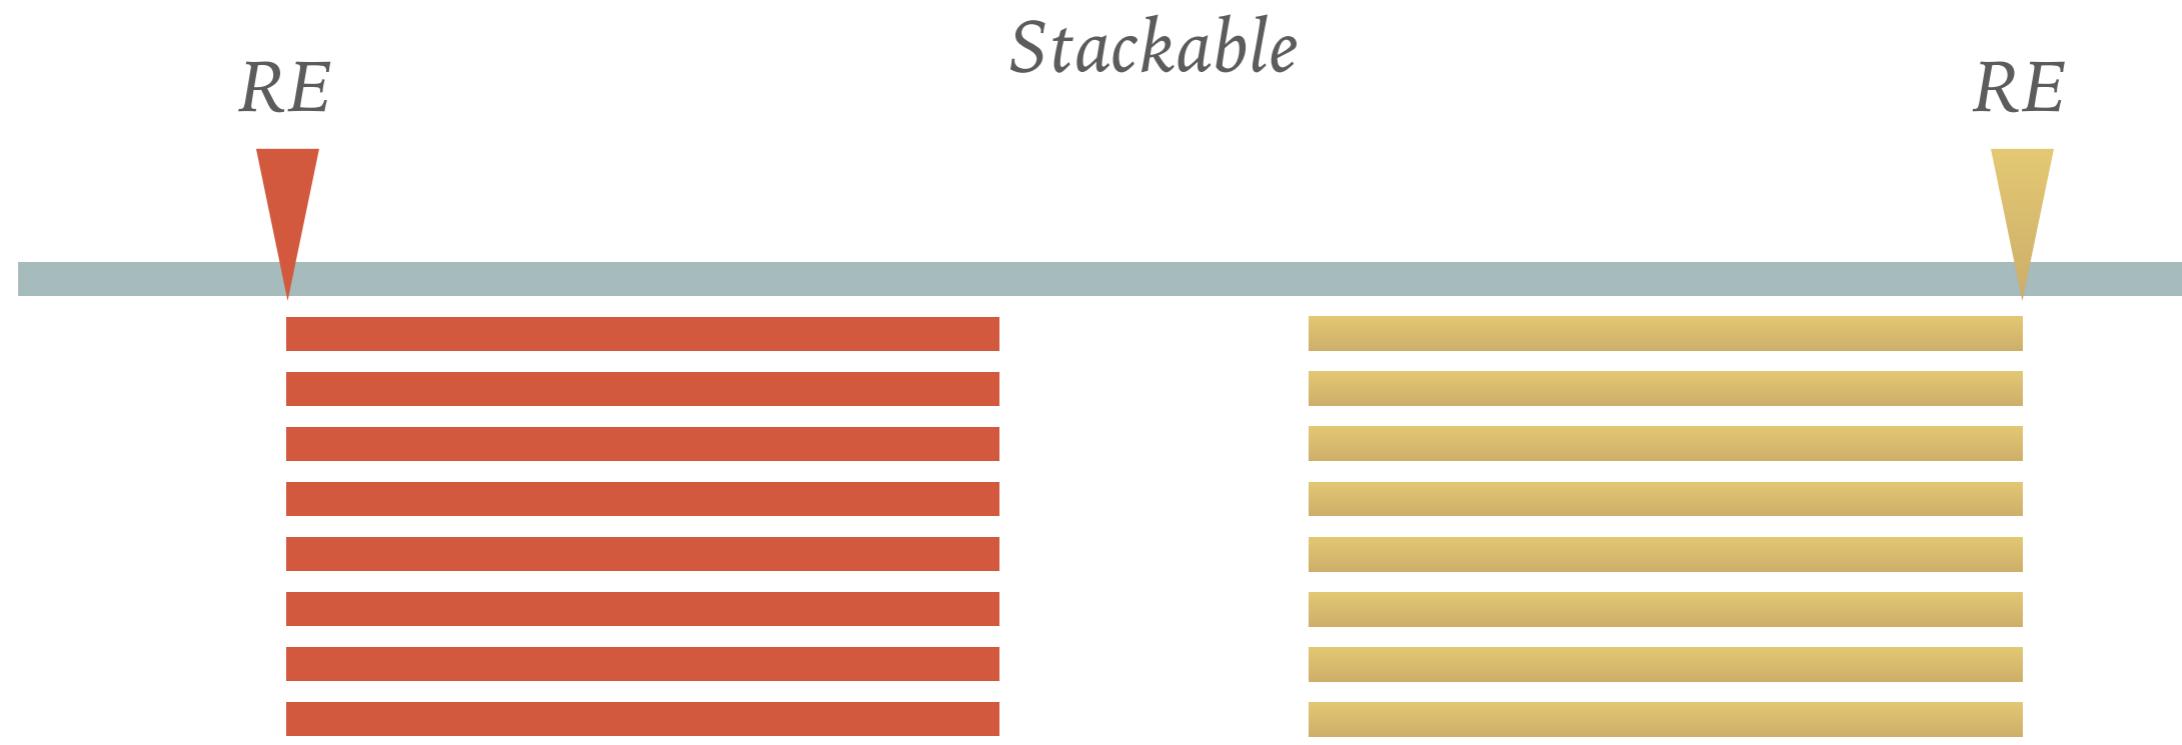

---

Pipeline/ Program	Alignment	Clustering	Comment
Stacks	Y	Y	
TASSEL-GBS	Y	Y	Trim reads
UNEAK	N	Y	Trim reads
PyRAD	N	Y	
dDocent	Y	N	
AftrRAD	N	Y	

# Stacks

---

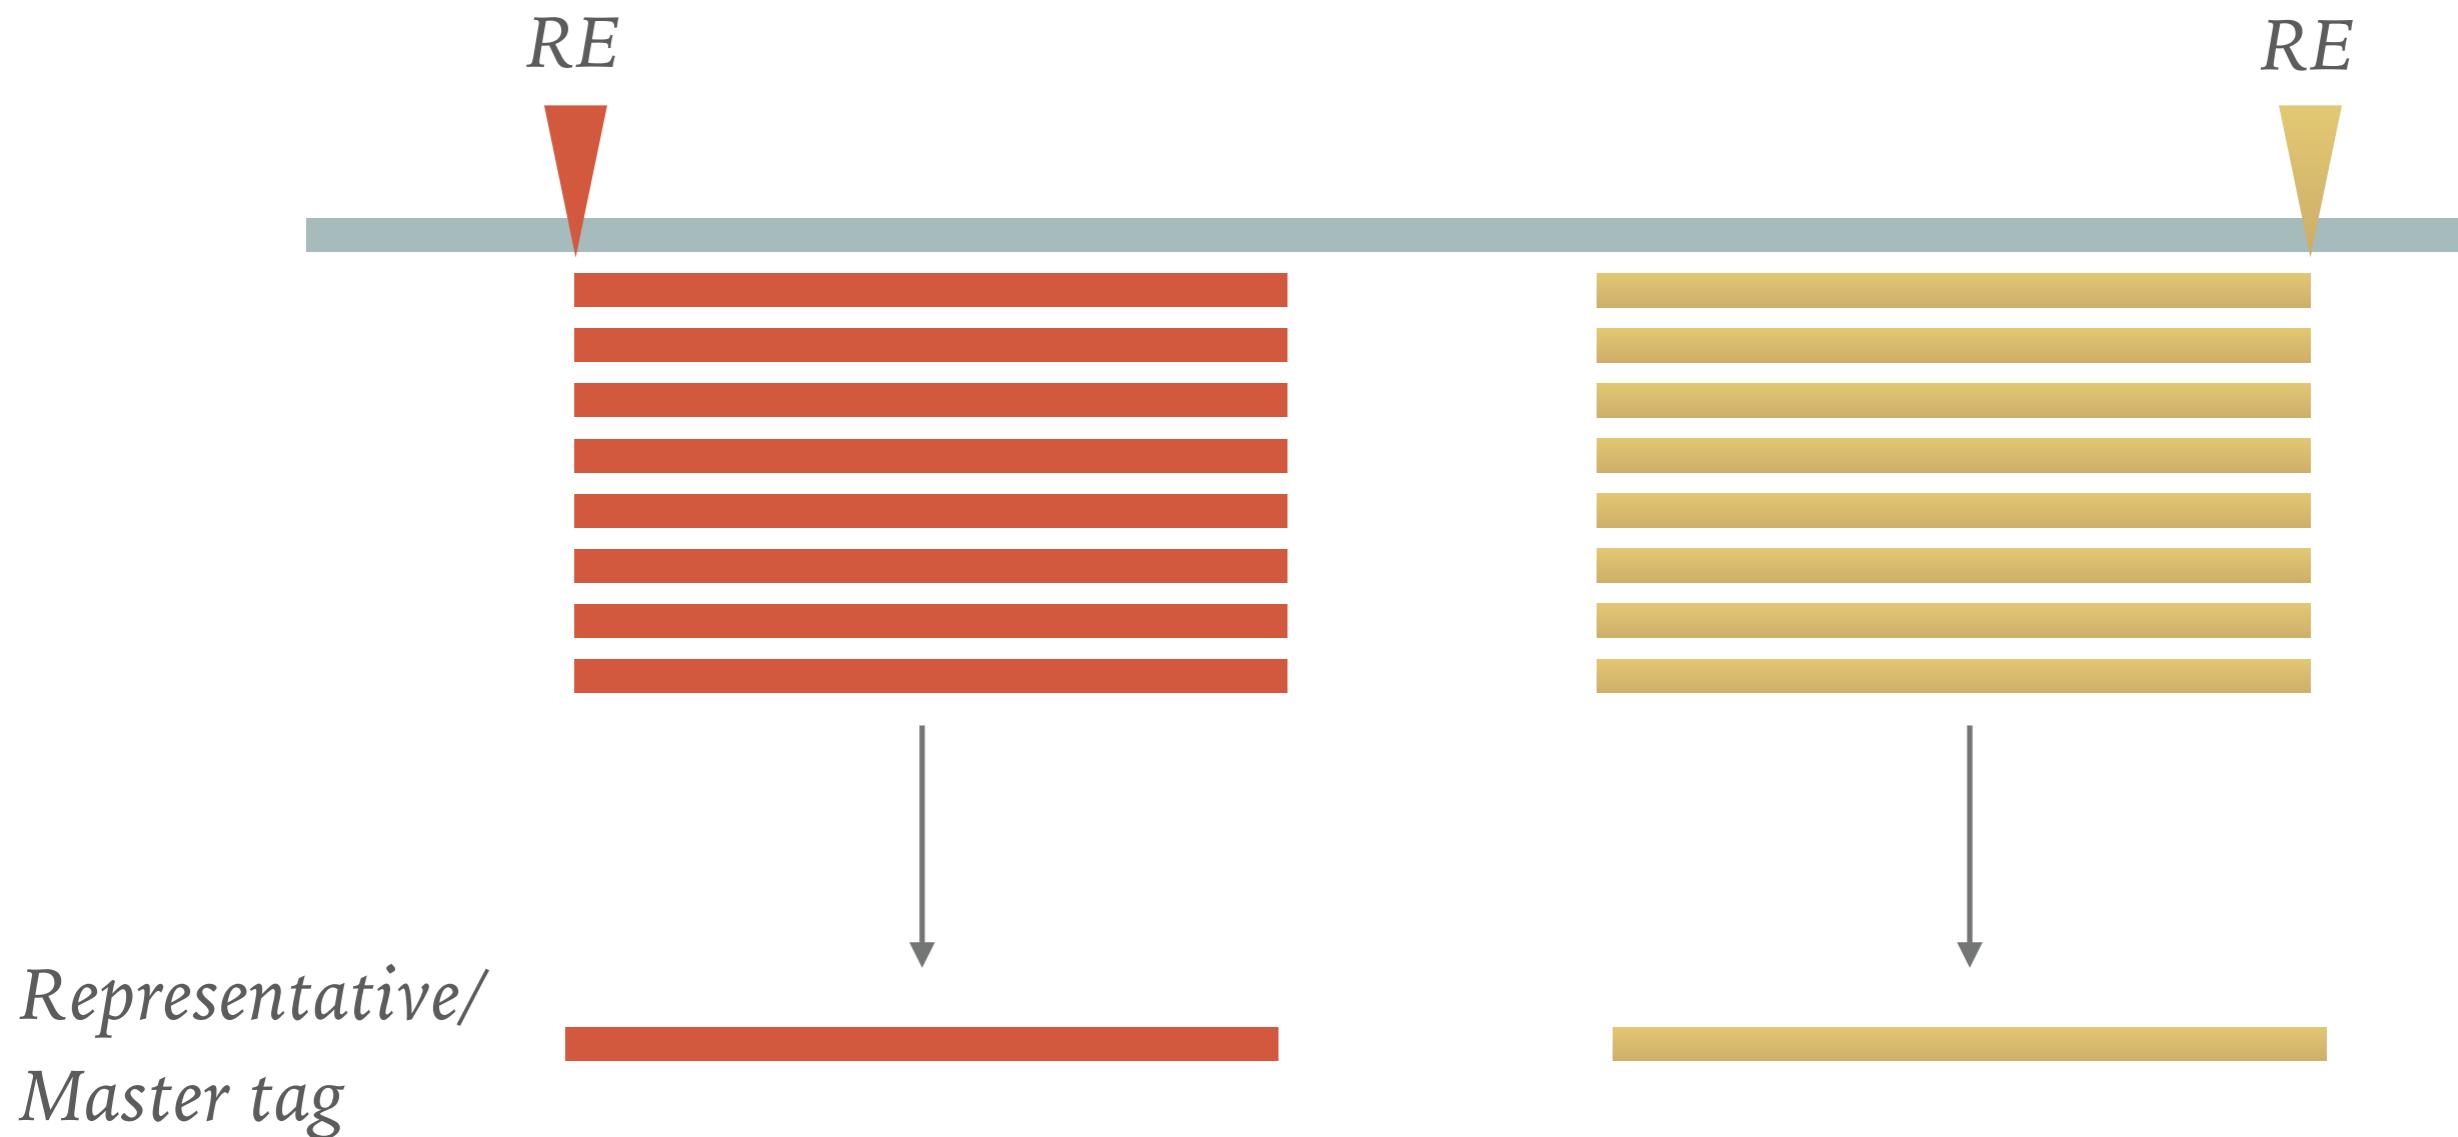

- Designed to work with short read (max 1024bp)
- Uniform length of reads
  - Ideal for Illumina
  - For Ion Torrent platform, reads would need to be truncated to a particular length
- Deal with most of the RADseq/GSB protocols
- *Stacks* is designed to process data that *stacks* together:
  - In the case of double-digest RAD, both the single-end and paired-end read are anchored by a restriction enzyme and can be assembled as independent loci;
  - In cases such as with the RAD protocol, where the molecules are sheared and the paired-end therefore does not stack-up, cannot be directly used.

# WHY CLUSTERING OR STACKING REDUCE THE COST OF COMPUTATION

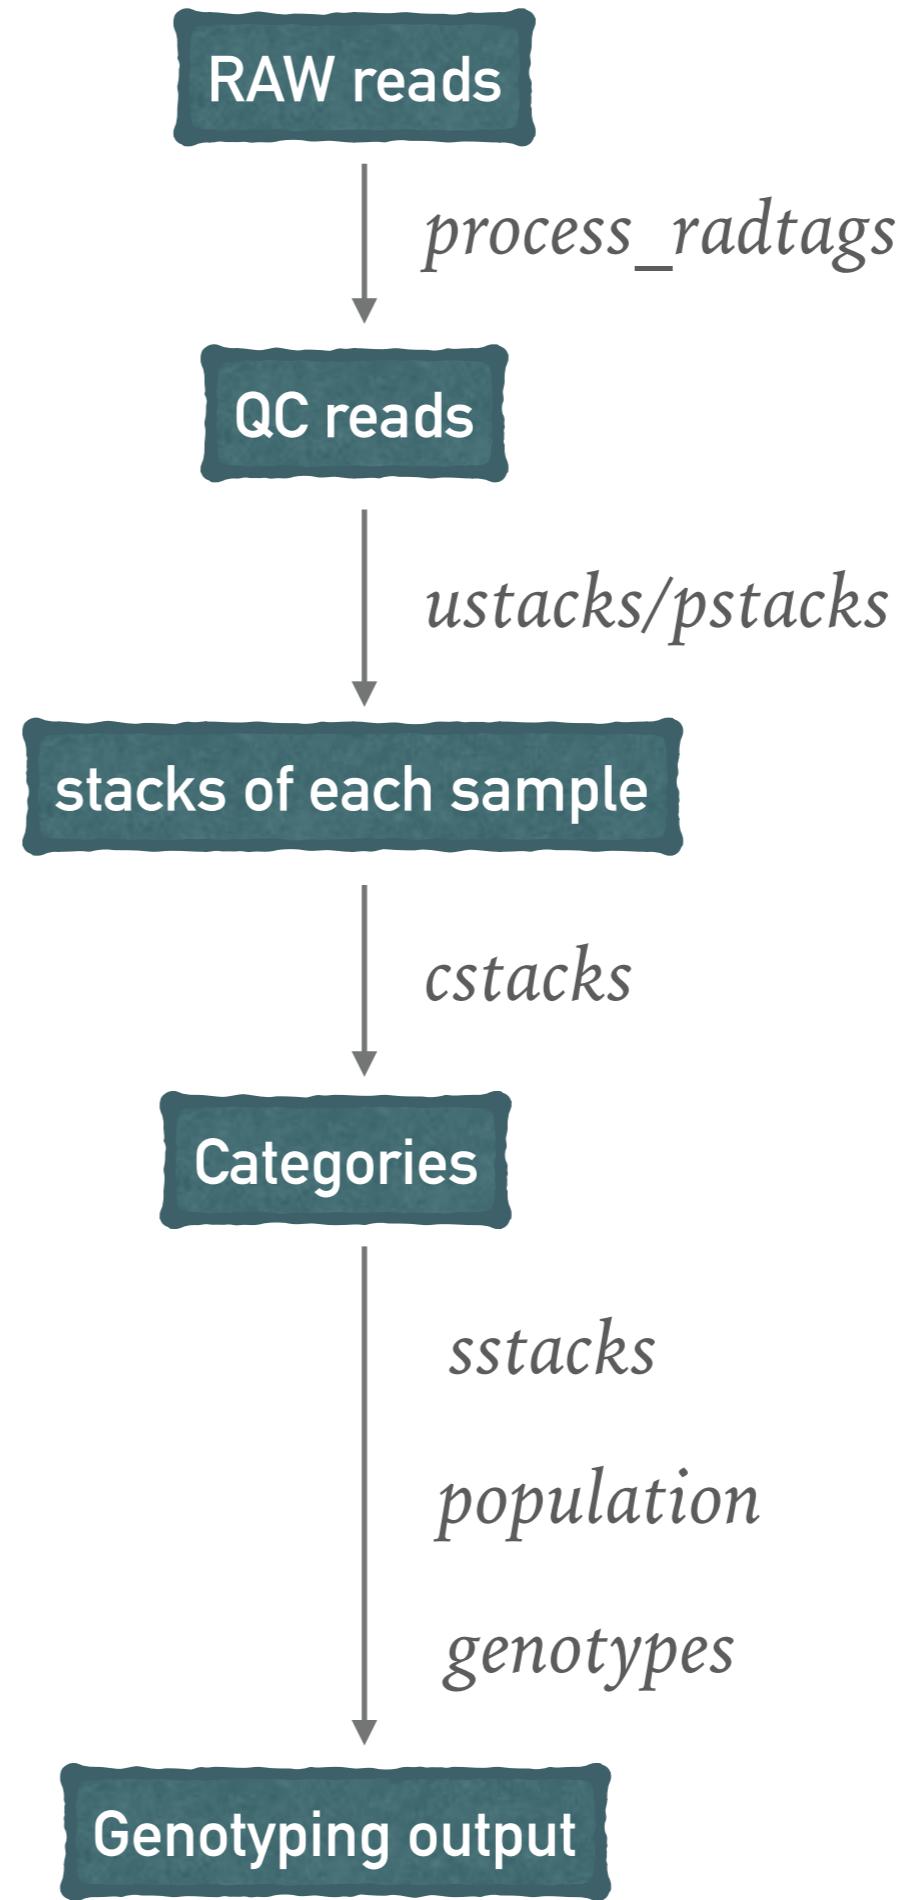

---

TASSEL-GBS:

*Instead of trying to map eight reads separately, we may just take one as representative.*

# Stacks workflow

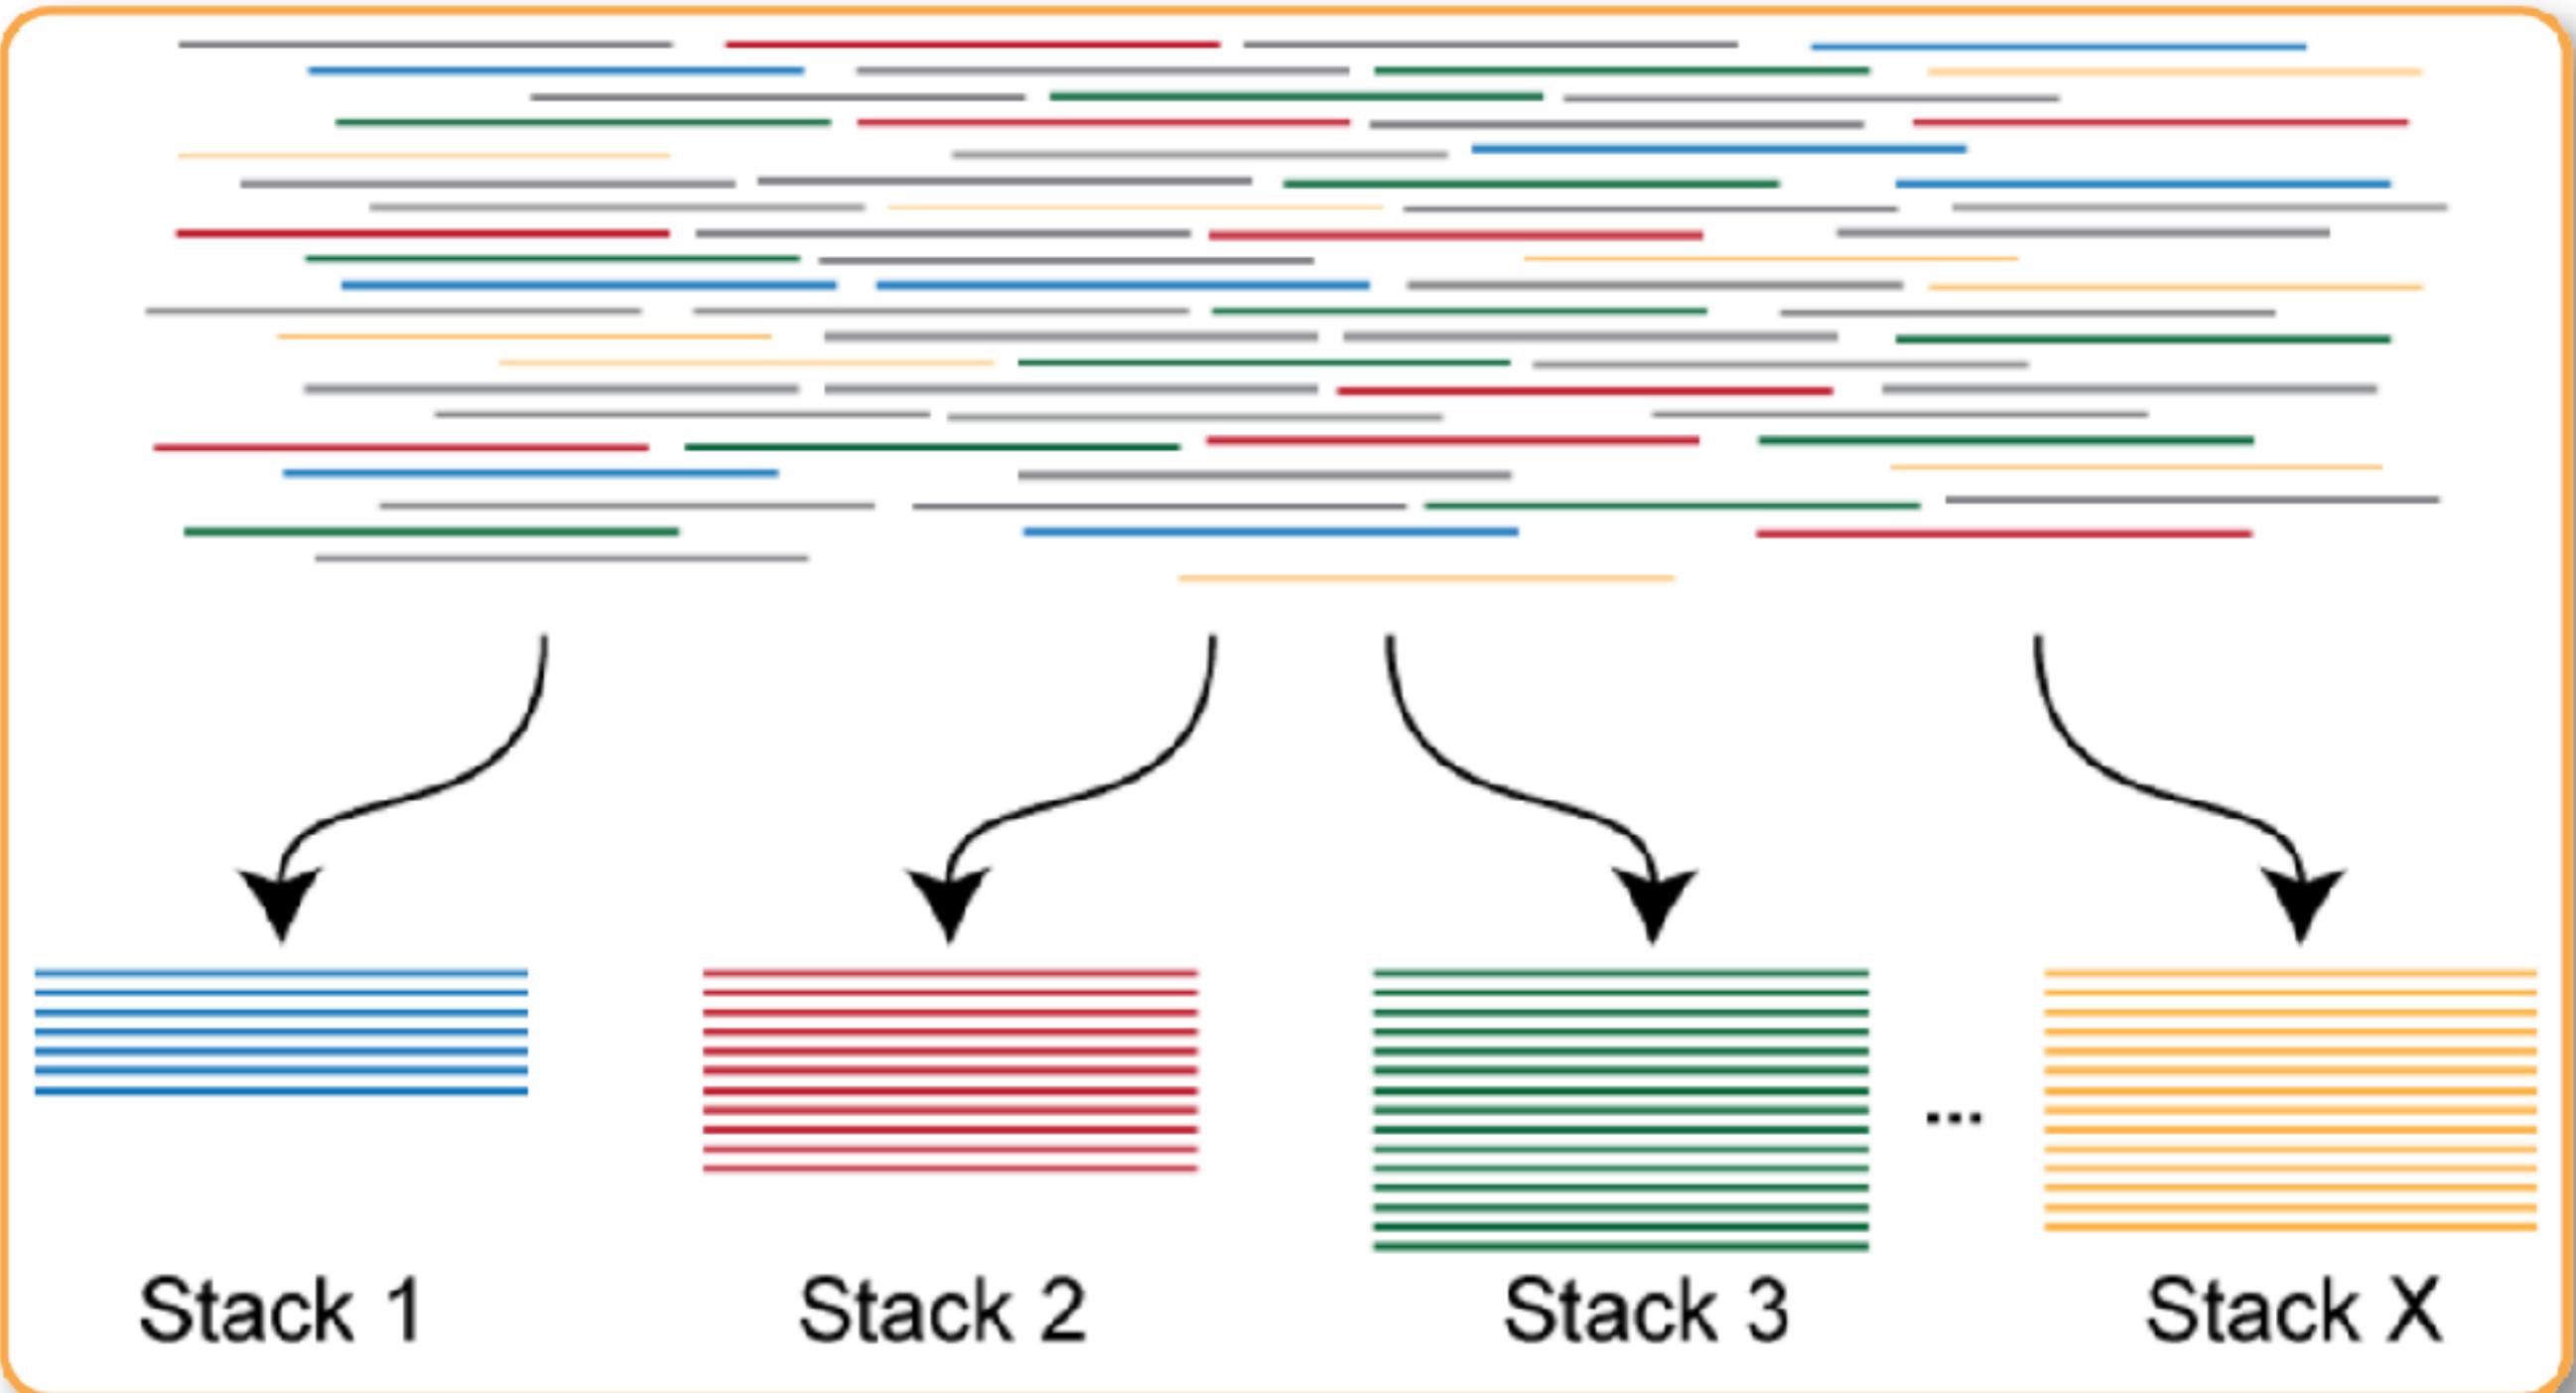

# MAJOR PARAMETERS

---

Parameter Description	<code>denovo_map.pl</code> Parameter	Pipeline component	Component Parameter	Default Value
Minimum stack depth / minimum depth of coverage	<code>-m</code>	<code>ustacks</code>	<code>-m</code>	3
Distance allowed between stacks	<code>-M</code>	<code>ustacks</code>	<code>-M</code>	2
Distance allowed between catalog loci	<code>-n</code>	<code>cstacks</code>	<code>-n</code>	0

# 1. MINIMUM STACK DEPTH

-m 3

# 1. MINIMUM STACK DEPTH

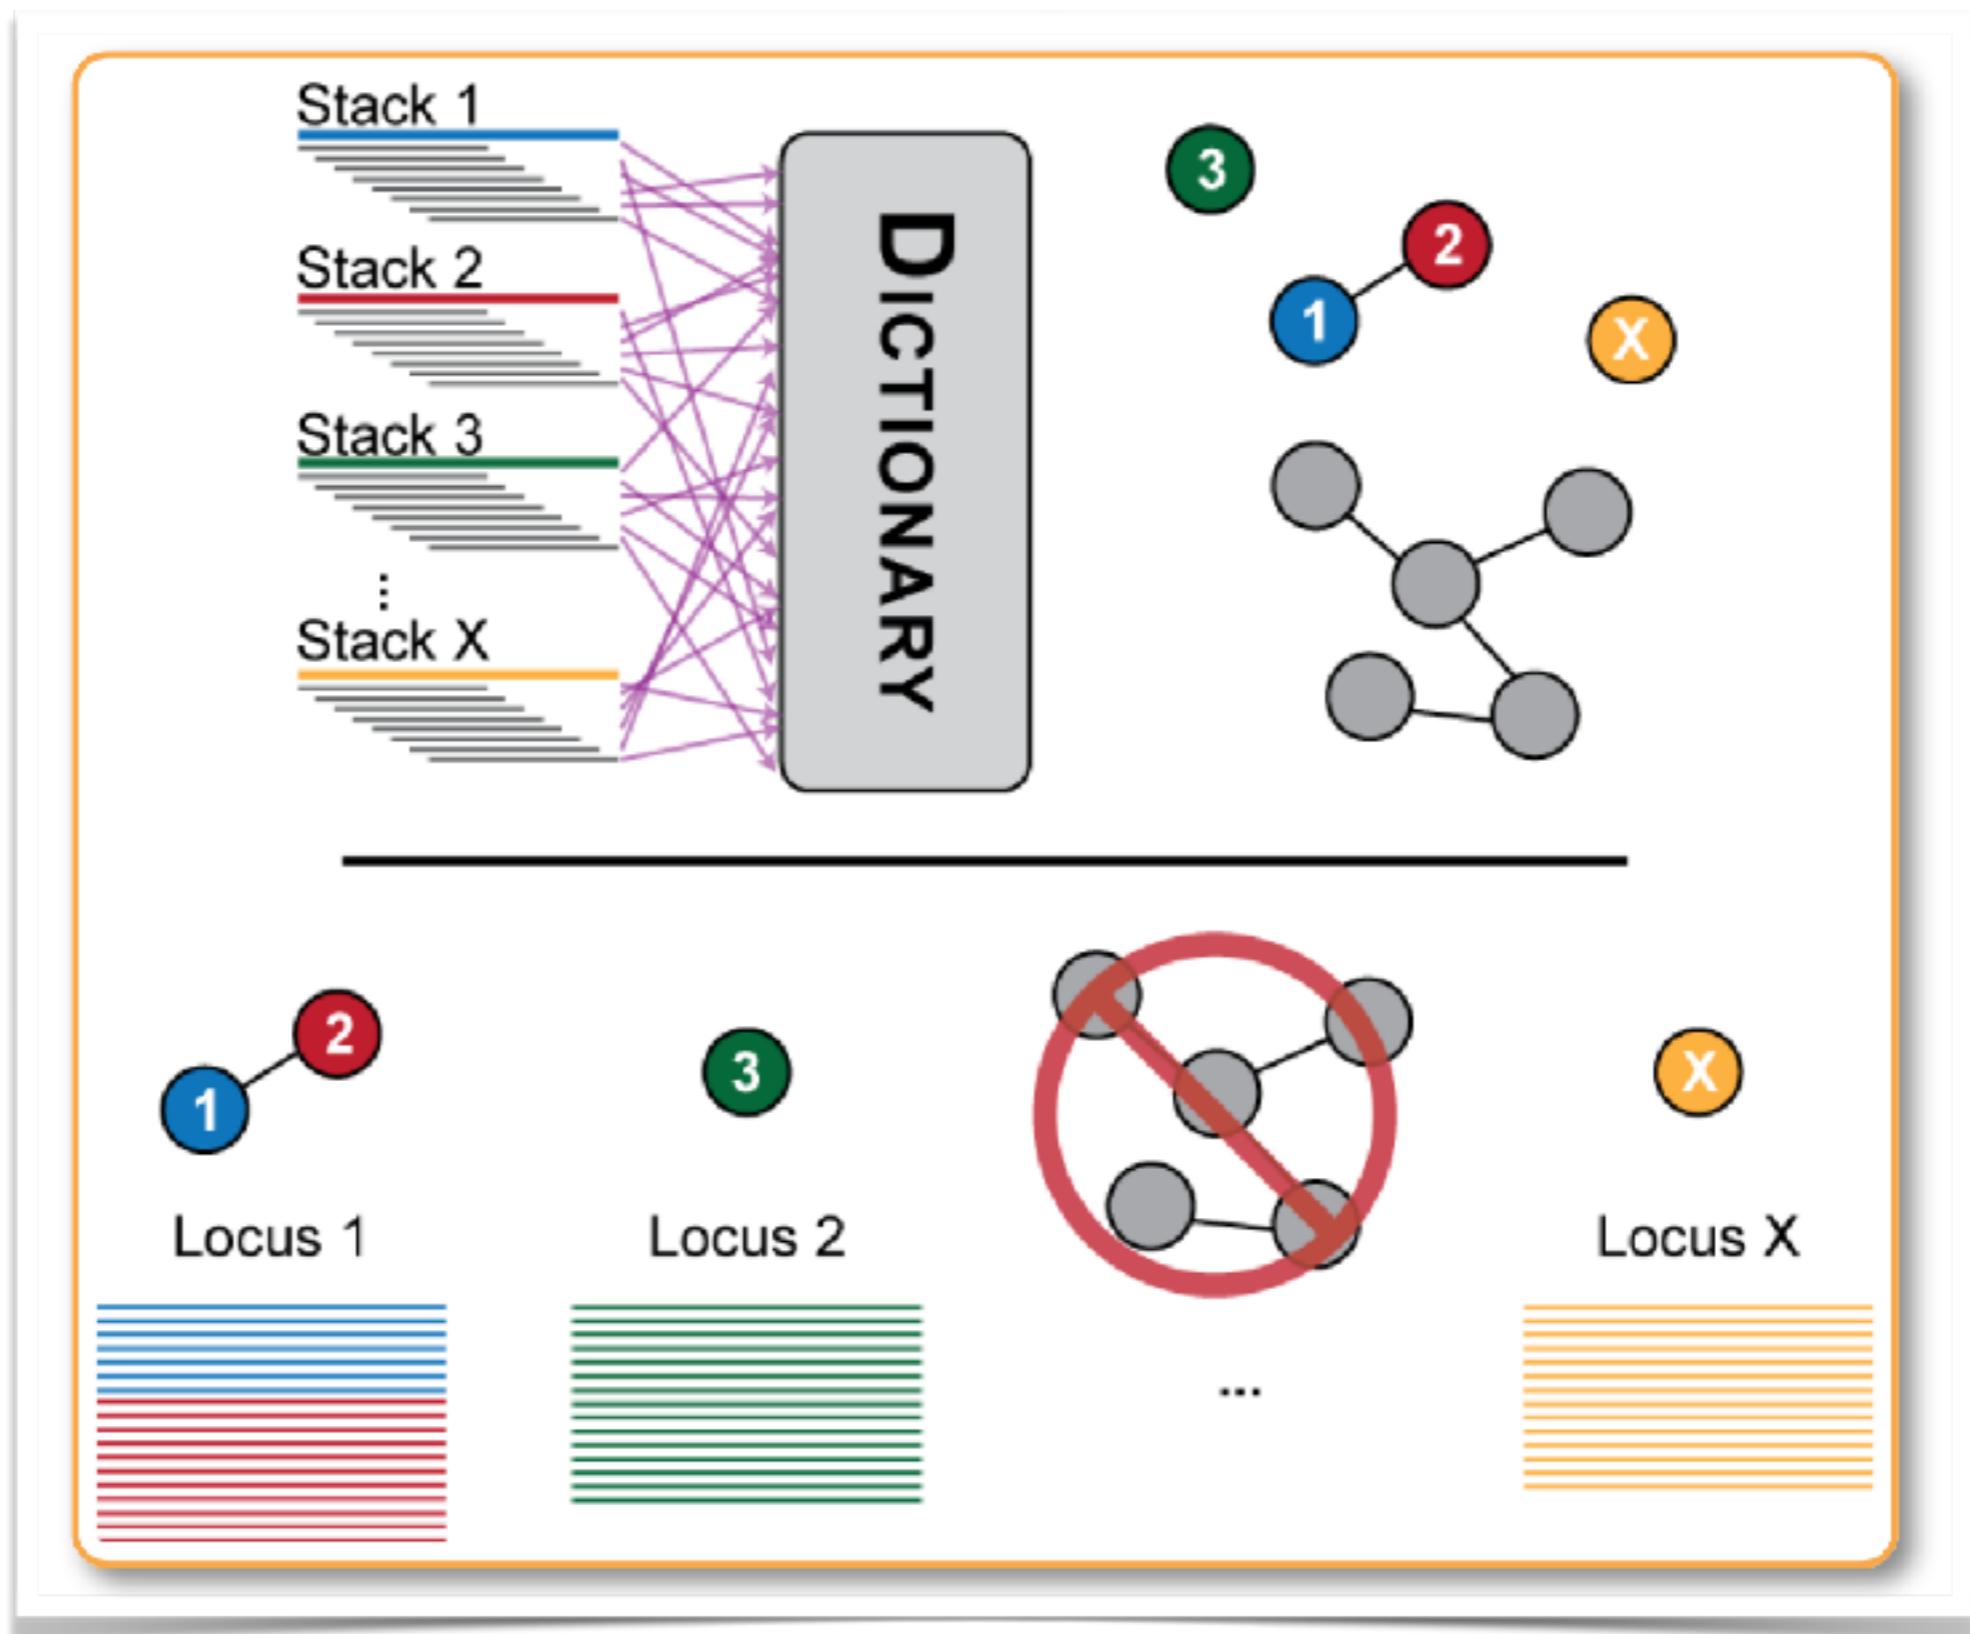

-m 3

---

- 1 If set to a value of 3 then three or more identical reads must be found to consider those reads a stack. If a stack is formed with only two reads, then those reads are set aside (**secondary reads**) and a stack is not constructed.
- 2 If this parameter is set too low, then reads with convergent sequencing errors are likely to be erroneously labeled as stacks.
- 3 If this parameter too high, then true alleles will not be recorded and will drop out of the analysis.
- 4 If you have low sequencing depth for your samples, you will have to set this parameter to a relatively low value. Conversely, if you have very high sequencing coverage, you will want to increase this parameter.
- 5 If you have a high error rate in your sequencing lane, then you are likely to see convergent sequencing or PCR errors (errors that occur independently at the same nucleotide position in the same read) and should increase the minimum stack depth.

## 2. DISTANCE ALLOWED BETWEEN STACKS

-M 2

## 2. DISTANCE ALLOWED BETWEEN STACKS

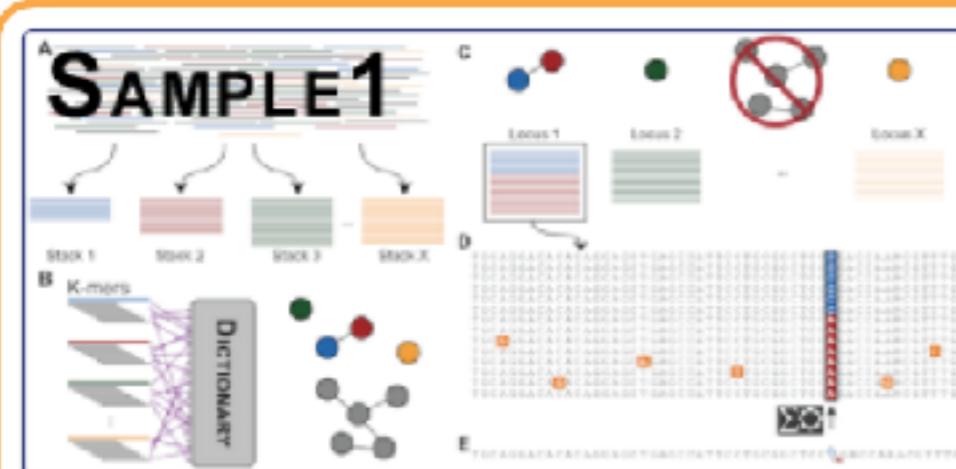

-M 2

---

- 1 If you set this parameter too low, then some loci will fail to be reconstructed. This means the SNPs contained in that locus will not be identified and this locus will appear as two loci to the remainder of the pipeline.
- 2 Setting this parameter too high will allow repetitive sequence to chain together in to large, nonsensical loci. For example, if stack A is one nucleotide apart from stack B, which is one nucleotide apart from stack C, which is one nucleotide apart from stack D, then A, B, C, and D will be merged into a locus despite A and D being four nucleotides apart. These loci are not useful to the pipeline and at several points the pipeline will try to detect these and set them aside.
- 3 You will want to experiment with several different values of this parameter to see how many polymorphic loci you can construct.

### 3. DISTANCE BETWEEN CATALOG LOCI

-n 0

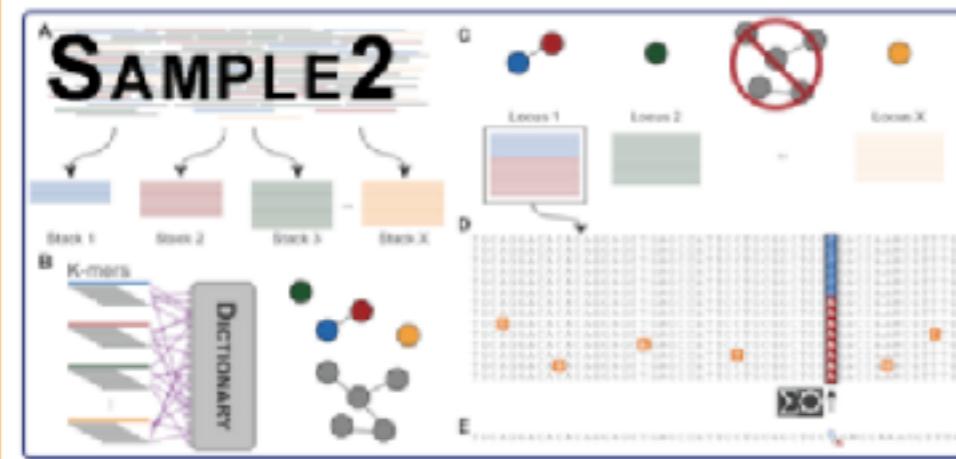

### CATALOG

#### Locus 1

TGCAAGACACACAGGACTGAGCCATTCTGGGCTCOOGAOCAAACGTTG

Haplotypes: **C** **A**

#### Locus 2

TGCAAGACACACAGGACTGAGCCATTCTGGGCTCOOGAOCAAACGTTG

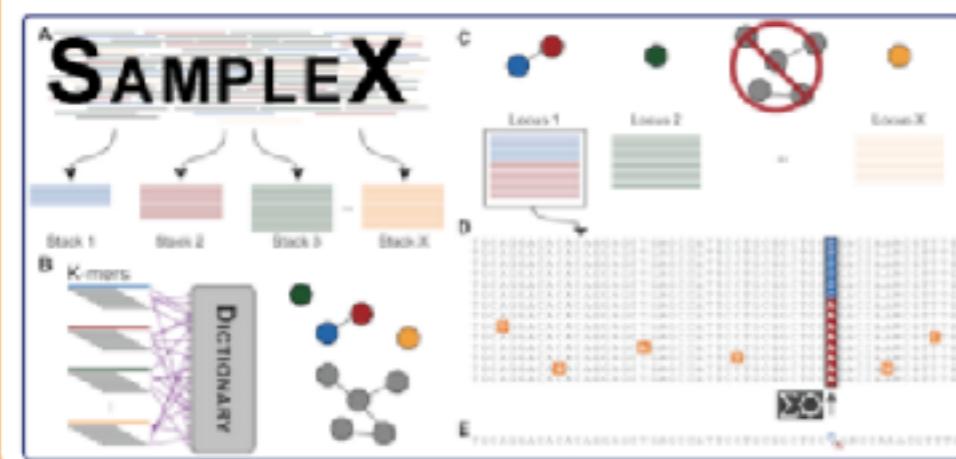

Haplotypes: **AC** **CT**

Haplotypes: **AA** **GG**

### 3. DISTANCE BETWEEN CATALOG LOCI

---

-n 0

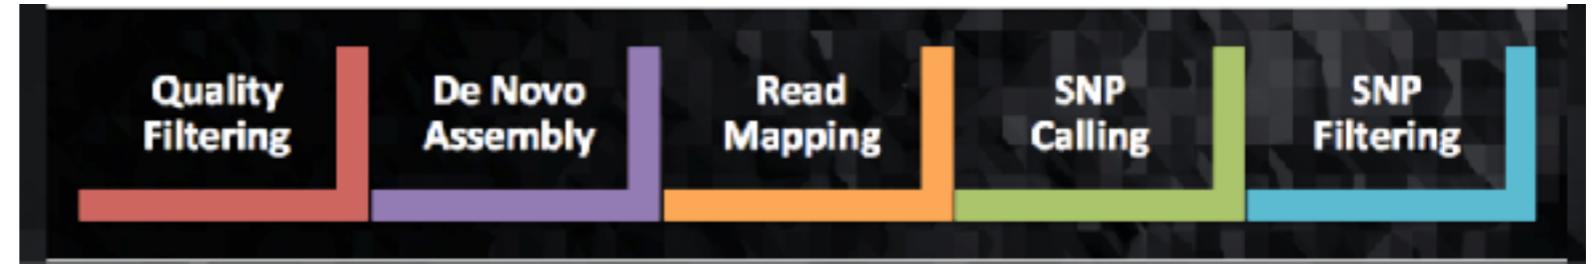

- 1 If you set this parameter too low, then some loci will fail to be reconstructed. This means the SNPs contained in that locus will not be identified and this locus will appear as two loci to the remainder of the pipeline.
- 2 Setting this parameter too high will allow repetitive sequence to chain together in to large, nonsensical loci. For example, if stack A is one nucleotide apart from stack B, which is one nucleotide apart from stack C, which is one nucleotide apart from stack D, then A, B, C, and D will be merged into a locus despite A and D being four nucleotides apart. These loci are not useful to the pipeline and at several points the pipeline will try to detect these and set them aside.
- 3 You will want to experiment with several different values of this parameter to see how many polymorphic loci you can construct.

# OPTIMIZE THE PARAMETERS

---

- How to optimize the parameters for my project?
- Simulation
  - With reference genome available, simulate RADseq/GBS reads from the reference genome with predefined SNPs;
  - Call SNPs with different set of parameters, pick the one with the lowest FP and/ high TP.
- Generate SNPs for multiple sets of parameters, then check the SNP accuracy

# DDOCENT PIPELINE

- dDocent relies almost entirely on third party software to complete every step of the analysis pipeline..

# DEMO OF GBS DATA ANALYSIS USING STACKS ON HPRC

---

Login to ada:      ssh your-tamu-netid@ada.tamu.edu

Create a folder:    mkdir stacks\_tutorial && cd stacks\_tutorial

Get the tutorial data: git clone <https://github.com/swang8/workshop>

Create working directory:

```
cd workshop/material/tutorial_data/
```

```
mkdir RAD && cd RAD
```

```
tar xvf ../rad_test.tar
```

```
ls -l
```

Run jobs on working nodes:    **bsub -Is -n2 -W10:00 /bin/bash**

# DEMO OF GBS DATA ANALYSIS USING STACKS ON HPRCGALAXY

---

For testing only: <https://hprcgalaxy.tamu.edu/fishcamp>

For real projects: <https://hprcgalaxy.tamu.edu/maroon>

The screenshot shows the homepage of the High Performance Research Computing (HPRC) website. The header features the text "High Performance Research Computing" and "A Resource for Research and Discovery". To the right is the Texas A&M University logo. The main navigation menu includes links for Home, About, User Services, Resources, Research, Policies, and a search bar. Below the menu, a large banner image displays a simulation of particle optics applications in geoscience and biomedicine, showing a map of the United States with a blue, glowing cloud-like pattern overlaid. Text on the banner reads "Simulation of Particle Optics: Applications in Geoscience and Biomedicine" and "Lei Bi, Bingqi Yi, Ping Yang, Lee Panetta" from the Department of Atmospheric Sciences. On the right side of the page, there is a "System Load Levels" section with tables for Ada and Curie systems, and a "Historical Usage" link.

**System Load Levels**

System	Nodes	Cores	Jobs
Ada	<a href="#">712/827 (86.09%)</a>	<a href="#">13996/16840 (83.11%)</a>	<a href="#">491R-704Q</a>
Curie	<a href="#">40/47 (85.11%)</a>	<a href="#">640/752 (85.11%)</a>	<a href="#">34R-67Q</a>
